Murgai, Robert K. Brayton, Alberto L. Sangiovanni-Vincentelli, 2012-12-06 Short turnaround has become critical in the design of electronic systems Software programmable components such as microprocessors and digital signal processors have been used extensively in such systems since they allow rapid design revisions However the inherent performance limitations of software programmable systems mean that they are inadequate for high performance designs Designers thus turned to gate arrays as a solution User programmable gate arrays field programmable gate arrays FPGAs have recently emerged and are changing the way electronic systems are designed and implemented The growing complexity of the logic circuits that can be packed onto an FPGA chip means that it has become important to have automatic synthesis tools that implement logic functions on these architectures Logic Synthesis for Field Programmable Gate Arrays describes logic synthesis for both look up table LUT and multiplexor based architectures with a balanced presentation of existing techniques together with algorithms and the system developed by the authors Audience A useful reference for VLSI designers developers of computer aided design tools and anyone involved in or with FPGAs Applications of Digital Signal Processing Using Field

Andrew C. Ling,2009 As Field Programmable Gate Array FPGA capacity can now support several processors on a single device the scalability of FPGA design tools and methods has emerged as a major obstacle for the wider use of FPGAs For example logic synthesis which has traditionally been the fastest step in the FPGA Computer Aided Design CAD flow now takes several hours to complete in a typical FPGA compile In this work we address this problem by focusing on two areas First we revisit FPGA logic synthesis and attempt to improve its scalability Specifically we look at a binary decision diagram BDD based logic synthesis flow referred to as FBDD where we improve its runtime by several fold with a marginal impact to the resulting circuit area We do so by speeding up the classical cut generation problem by an order of magnitude which enables its application directly at the logic synthesis level Following this we introduce a guided partitioning technique using a fast global budgeting formulation which enables us to optimize individual pockets within the circuit without degrading the overall circuit performance By using partitioning we can significantly reduce the solution space of the logic synthesis problem and furthermore open up the possibility of parallelizing the logic synthesis step The second area we look at is the area of Engineering Change Orders ECOs ECOs are incremental modifications to a design late in the design flow This is beneficial since it is minimally disruptive to the existing circuit which preserves much of the engineering effort invested previously in the design In a design flow where most of the steps are fully automated ECOs still remain largely a manual process This can often tie up a designer for weeks leading to missed project deadlines which is very detrimental to products whose life cycle can span only a few months As a solution to this we show how we can leverage existing logic synthesis techniques to automatically modify a circuit in a minimally disruptive manner This can significantly reduce the turn around time when applying ECOs
