*Third Generation CDMA Systems for Enhanced Data Services* Giridhar D. Mandyam, Jersey Lai, 2002-08-16 The use of mobile communication devices has grown phenomenally throughout the world during the last few years With strong consumer demand to increase data delivery large emails browsing the Internet on wireless devices transferring video images etc engineers are faced with the challenge of enhancing CDMA to provide larger data capabilities while improving voice signals for clearer reception In November 2001 the U S Federal Communications Commission released a much broader band of frequencies to wireless service providers which will speed up the development of these systems Simulation results demonstrate the performance benefits of the proposed systems versus their third generation predecessors Up to date overview of the standardised air interface      Coherent Time Difference of Arrival Estimation Techniques for Frequency

Hopping GSM Mobile Radio Signals Alexander Gerald Götz, 2013-07-22 In this work coherent techniques for time difference of arrival estimation for frequency hopping GSM signals are introduced The techniques provide significant improvements in accuracy compared to state of the art techniques and are ideally suited for highly accurate localization of GSM mobile phones The key inventive concept is based on the interpretation of a frequency hopping GSM signal as a wideband signal

Thus the applicable bandwidth for time difference of arrival estimation can be increased from 200 kHz for the narrowband burst signal to the full uplink bandwidth of the corresponding GSM standard For E GSM 900 systems up to 35 MHz of bandwidth can be employed Consequently a localization accuracy in the scale of 5 10m is achievable The presented coherent techniques for time difference of arrival estimation permit novel applications with increased accuracy requirements such as highly accurate localization in search and rescue scenarios Furthermore the coherent estimation concept can also be adapted to any frequency hopping signal source such as TETRA DECT IEEE 802 15 4 ZigBee and IEEE 802 15 1 Bluetooth devices

Godsill,Peter J.W. Rayner,2013-12-21 The application of digital signal processing DSP to problems in audio has been an area of growing importance since the pioneering DSP work of the 1960s and 70s In the 1980s DSP micro chips became sufficiently powerful to handle the complex processing operations required for sound restoration in real time or close to real time This led to the first commercially available restoration systems with companies such as CEDAR Audio Ltd in the UK and Sonic Solutions in the US selling dedicated systems world wide to recording studios broadcasting companies media archives and film studios Vast amounts of important audio material ranging from historic recordings of the last century to relatively recent recordings on analogue or even digital tape media were noise reduced and re released on CD for the increasingly quality conscious music enthusiast Indeed the first restorations were a revelation in that clicks crackles and hiss could for the first time be almost completely eliminated from recordings which might otherwise be unreleasable in CD format Until recently however digital audio processing has required high powered computational engines which were only available to large institutions who could afford to use the sophisticated digital remastering technology With the advent of compact disc and other digital audio formats followed by the increased accessibility of home computing digital audio processing is now available to anyone who owns a PC with sound card and will be of increasing importance in association with digital video as the multimedia revolution continues into the next millennium      *Radio Frequency Integrated Circuit Design* John W.
