Abstract: In order to avoid resonance of a mixed flow pump impeller and to avoid blade failure due to excessive stress development, it is required to know the natural frequencies at different modes and one should have an idea about the Von Mises stress distribution in the impeller blades. In this present work design and FEM analysis has been carried out on mixed flow pump impeller having different blade positions on the meridional annulus. The natural frequencies at six different modes of the pump impeller were obtained. The maximum Von Mises stress distribution was compared among the impellers having different blade positions. The mixed flow impeller having inlet inclined blade positions on the meridional annulus experiences less amount of Von Mises stress as compared to impeller having trapezoidal blade positions on the meridional annulus. The natural frequencies of the impeller having inlet inclined blade positions on the meridional annulus shows a higher value as compared to compared to impeller having trapezoidal blade positions on the meridional annulus.

1. INTRODUCTION

The mixed flow pumps are extensively used in thermal power plants for cooling water duties. The performance of a mixed flow pump can be considerably improved by applying recent advances in understanding the flow behavior of the pump and the blades. Thus, optimal blade position in the meridional annulus has an important effect on loss and flow deflection. The objective of the blade design is to realize a given velocity triangle with minimum losses as well as minimum stress development in the blade sections.

The industrial design methods are largely based on the application of empirical and semi-empirical rules along with the use of available information in the form of different types of charts and graphs from the existing literature. Impellers are mainly designed using profile
