Development of Modelica Library for Dynamics Simulation of CHP Plant Amir Abdul Razak,2011-11 **Development of the Structure of a Software Library Applying the Modeling Language Modelica for Dynamic Simulation of Combined Heat and Power Plants** Amir Abdul Razak,2009 **Modelica-based Modeling and Simulation to Support Research and Development in Building Energy and Control Systems** ,2009 Traditional building simulation programs possess attributes that make them difficult to use for the design and analysis of building energy and control systems and for the support of model based research and development of systems that may not already be implemented in these programs This article presents characteristic features of such applications and it shows how equation based object oriented modelling can meet requirements that arise in such applications Next the implementation of an open source component model library for building energy systems is presented The library has been developed using the equation based object oriented Modelica modelling language Technical challenges of modelling and simulating such systems are discussed Research needs are presented to make this technology accessible to user groups that have more stringent requirements with respect to the numerical robustness of simulation than a research community may have Two examples are presented in which models from the here described library were used The first example describes the design of a controller for a nonlinear model of a heating coil using model reduction and frequency domain analysis The second example describes the tuning of control parameters for a static pressure reset controller of a variable air volume flow system The tuning has been done by solving a non convex optimization problem that minimizes fan energy subject to state constraints *Modelica Buildings Library* ,2013 This paper describes the Buildings library a free open source library that is implemented in Modelica an equation based object oriented modeling language The library supports rapid prototyping as well as design and operation of building energy and control systems First we describe the scope of the library which covers HVAC systems multi zone heat transfer and multi zone airflow and contaminant transport Next we describe differentiability requirements and address how we implemented them We describe the class hierarchy that allows implementing component models by extending partial implementations of base models of heat and mass exchangers and by instantiating basic models for conservation equations and flow resistances We also describe associated tools for pre and post processing regression tests co simulation and real time data exchange with building automation systems Furthermore the paper closes with an example of a chilled water plant with and without water side economizer in which we analyzed the system level efficiency for different control setpoints **A Modelica-based Model Library for Building Energy and Control Systems** ,2009 This paper describes an open source library with component models for building energy and control systems that is based on Modelica an equation based objectoriented language that is well positioned to become the standard for modeling of dynamic systems in various industrial sectors The

library is currently developed to support computational science and engineering for innovative building energy and control systems Early applications will include controls design and analysis rapid prototyping to support innovation of new building systems and the use of models during operation for controls fault detection and diagnostics This paper discusses the motivation for selecting an equation based object oriented language It presents the architecture of the library and explains how base models can be used to rapidly implement new models To demonstrate the capability of analyzing novel energy and control systems the paper closes with an example where we compare the dynamic performance of a conventional hydronic heating system with thermostatic radiator valves to an innovative heating system In the new system instead of a centralized circulation pump each of the 18 radiators has a pump whose speed is controlled using a room temperature feedback loop and the temperature of the boiler is controlled based on the speed of the radiator pump All flows are computed by solving for the pressure distribution in the piping network and the controls include continuous and discrete time controls
