- 1.1** An ADD/SUBTRACT logic circuit is shown below. It performs the ADD operation for $P = 0$, and SUBTRACT for $P = 1$.
- Draw an equivalent CMOS logic diagram by noting that most CMOS gates, except for transmission gate and XOR, are inverting. For example, AND gate is implemented with NAND followed by an inverter.
 - By using the gate array platform given on page 47, implement the CMOS circuit as compactly as possible with the aspect ratio, which is the ratio of vertical dimension to horizontal dimension, as close to 1 as possible.

Integrated Circuit and System Design. Power and Timing Modeling, Optimization and Simulation Vassilis Paliouras,Johan Vounckx,Diederik Verkest,2005-08-25 Welcome to the proceedings of PATMOS 2005 the 15th in a series of international workshops PATMOS2005wasorganizedbyIMECwithtechnicalco sponsorshipfrom the IEEE Circuits and Systems Society Over the years PATMOS has evolved into an important European event where searchers from both industry and academia discuss and investigate the emerging ch lenges in future and contemporary applications design methodologies and

tools required for the development of upcoming generations of integrated circuits and systems. The technical program of PATMOS 2005 contained state-of-the-art technical contributions, three invited talks, a special session on hearing aid design, and an embedded tutorial. The technical program focused on timing performance and power consumption as well as architectural aspects with particular emphasis on modeling, design characterization, analysis, and optimization in the nanometer era. The Technical Program Committee, with the assistance of additional expert reviewers, selected the 74 papers to be presented at PATMOS. The papers were divided into 11 technical sessions and 3 poster sessions. As is always the case with the PATMOS workshops, the review process was anonymous; full papers were required, and several reviews were carried out per paper. Beyond the presentations of the papers, the PATMOS technical program was enriched by a series of speeches offered by world-class experts on important emerging research issues of industrial relevance. Prof. Jan Rabaey (Berkeley, USA) gave a talk on "Traveling the Wild Frontier of Ultra-Low Power Design." Dr. Sung Bae Park (Sung) gave a presentation on "DVL: Deep Low Voltage Circuits and Devices." Prof. **Software Engineering Perspectives in Intelligent Systems** (Radek, Silhavy, Petr Silhavy, Zdenka Prokopova, 2020-12-15). This book constitutes the refereed proceedings of the 4th Computational Methods in Systems and Software 2020 (CoMeSySo 2020) proceedings. Software engineering, computer science, and artificial intelligence are crucial topics for the research within an intelligent systems problem domain. The CoMeSySo 2020 conference is breaking the barriers by being held online. CoMeSySo 2020 intends to provide an international forum for the discussion of the latest high-quality research results. **Ultra-Low-Voltage Design of Energy-Efficient Digital Circuits** (Nele Reynders, Wim Dehaene, 2015-04-14). This book focuses on increasing the energy efficiency of electronic devices so that portable applications can have a longer stand-alone time on the same battery. The authors explain the energy efficiency benefits that ultra-low voltage circuits provide and provide answers to tackle the challenges which ultra-low voltage operation poses. An innovative design methodology is presented, verified, and validated by four prototypes in advanced CMOS technologies. These prototypes are shown to achieve high energy efficiency through their successful functionality at ultra-low supply voltages. *Single-chip Bluetooth Solutions* (Sudepto Chakraborty, 2001). **Solutions Manual to Accompany Analysis and Design of Digital Integrated Circuits** (David A. Hodges, Yu Chen, Horace G. Jackson, 1983). **Efficient Design of Variation-Resilient Ultra-Low Energy Digital Processors** (Hans Reyserhove, Wim Dehaene, 2019-03-27). This book enables readers to achieve ultra-low energy digital system performance. The author's main focus is the energy consumption of microcontroller architectures in digital sub-systems. The book covers a broad range of topics extensively, from circuits through design strategy to system architectures. The result is a set of techniques and a context to realize minimum energy digital systems. Several prototype silicon implementations are discussed, which put the proposed techniques to the test. The achieved results demonstrate an extraordinary combination of variation resilience, high-speed performance, and ultra-low energy.
