Robotic Vision Peter Corke, 2021-10-15 This textbook offers a tutorial introduction to robotics and Computer Vision which is light and easy to absorb The practice of robotic vision involves the application of computational algorithms to data Over the fairly recent history of the fields of robotics and computer vision a very large body of algorithms has been developed However this body of knowledge is something of a barrier for anybody entering the field or even looking to see if they want to enter the field What

is the right algorithm for a particular problem and importantly How can I try it out without spending days coding and debugging it from the original research papers The author has maintained two open source MATLAB Toolboxes for more than 10 years one for robotics and one for vision The key strength of the Toolboxes provide a set of tools that allow the user to work with real problems not trivial examples For the student the book makes the algorithms accessible the Toolbox code can be read to gain understanding and the examples illustrate how it can be used instant gratification in just a couple of lines of MATLAB code The code can also be the starting point for new work for researchers or students by writing programs based on Toolbox functions or modifying the Toolbox code itself The purpose of this book is to expand on the tutorial material provided with the toolboxes add many more examples and to weave this into a narrative that covers robotics and computer vision separately and together The author shows how complex problems can be decomposed and solved using just a few simple lines of code and hopefully to inspire up and coming researchers The topics covered are guided by the real problems observed over many years as a practitioner of both robotics and computer vision It is written in a light but informative style it is easy to read and absorb and includes a lot of Matlab examples and figures The book is a real walk through the fundamentals light and color camera modelling image processing feature extraction and multi view geometry and bring it all together in a visual servo system An authoritative book reaching across fields thoughtfully conceived and brilliantly accomplished Oussama Khatib Stanford

Developments and Applications of Block Toeplitz Iterative Solvers Xiao-Qing Jin, 2003-02-28 This volume contains the latest developments in the use of iterative methods to block Toeplitz systems These systems arise in a variety of applications in mathematics scientific computing and engineering such as image processing numerical differential equations and integral equations time series analysis and control theory Iterative methods such as Krylov subspace methods and multigrid methods are proposed to solve block Toeplitz systems One of the main advantages of these iterative methods is that the operation cost of solving a large class of $m \times n$ block Toeplitz systems only requires $O(mn \log mn)$ operations This book is the first book on Toeplitz iterative solvers and it includes recent research results The author belongs to one of the most important groups in the field of structured matrix computation The book is accessible to readers with a working knowledge of numerical linear algebra It should be of interest to everyone who deals with block Toeplitz systems numerical linear algebra partial differential equations ordinary differential equations image processing and approximation theory

Mathematics H Neunzert, Abul Hasan Siddiqi, 2013-06-29 Industrial Mathematics is a relatively recent discipline. It is
concerned primarily with transforming technical, organizational and economic problems posed by industry into mathematical
problems, solving these problems by approximate methods of analytical and/or numerical nature and finally reinterpreting
the results in terms of the original problems. In short, industrial mathematics is modelling and scientific computing of
industrial problems. Industrial mathematicians are bridge builders; they build bridges from the field of mathematics to the
practical world. To do that, they need to know about both sides: the problems from the companies and ideas and methods from
mathematics. As mathematicians, they have to be generalists. If you enter the world of industry, you never know which kind of
problems you will encounter and which kind of mathematical concepts and methods you will need to solve them. Hence, to be
a good industrial mathematician, you need to know a good deal of mathematics as well as ideas already common in
engineering and modern mathematics with tremendous potential for application. Mathematical concepts like wavelets,
pseudorandom numbers, inverse problems, multigrid, etc., introduced during the last 20 years, have recently started entering
the world of real applications. Industrial mathematics consists of modelling, discretization, analysis and visualization. To make
a good model to transform the industrial problem into a mathematical one such that you can trust the prediction of the
model is no easy task. Data Science and Artificial Intelligence for Digital Healthcare Pradeep Kumar Singh, Marcello

Trovati, Fionn Murtagh, Mohammed Atiquzzaman, Mohsen Farid, 2024-08-24 This book explores current research and
development in the area of digital healthcare using recent technologies such as data science and artificial intelligence. The
authors discuss how data science, AI and mobile technologies provide the fundamental backbone to digital healthcare,
presenting each technology separately as well as covering integrated solutions. The book also focuses on the integration of
different multidisciplinary approaches along with examples and case studies. In order to identify the challenges with security
and privacy issues, relevant blockchain technologies are identified and discussed. Social aspects related to digital solutions
and platforms for healthcare are also discussed and analyzed. The book aims to present high-quality technical contributions in
the field of mobile digital healthcare using technologies such as AI, deep learning, IoT and distributed cloud computing.
