designers builders owner s engineers and academic researchers will be asked how to solve this difficult problem In general most of the CO2 emissions in the life cycle of structural concrete come from the production stage of materials and the use stage after construction i e A1 to A3 and B1 to B5 processes as defined in EN15978 Cement and steel sectors which are the main materials for structural concrete are expected to take various measures to achieve zero carbon in their respective sectors by 2050 Until then we must deal with the transition with our low carbon technologies Regarding the production stage the fib has recently launched TG4 8 Low carbon concrete And the latest low carbon technologies will be discussed there On the other hand in the use stage there is very little data on the relationship between durability and intervention and maintenance so far The data accumulation here is the work of the fib a group of various experts on structural concrete Through life management using highly durable structures and precise monitoring will enable to realize minimum maintenance in the use stage and to minimize CO2 emissions Furthermore it is also possible to contribute to the reduction of CO2 emissions in the further stage after the first cycle by responding to the circular economy that is deconstruction C reuse and recycle D However the technology in this field is still in its infancy and further research and development is expected in the future As described above structural concrete can be carbon neutral in all aspects of its conception and it can make a significant contribution when it is realized The fib will have to address these issues in the future Of course it will not be easy and it will take time However if we do not continue our efforts as the only international academic society on structural concrete in the world to achieve carbon neutrality the significance of our very existence may be questioned Long before Portland cement was invented Roman concrete made of volcanic ash and other materials was the ultimate low carbon material and is still in use 2 000 years later because of its non reinforced structure and lack of deterioration factors Reinforced concrete which made it possible to apply concrete to structures other than arches and domes is only 150 years old Prestressed concrete is even younger with only 80 years of history Now that we think about it we realize that Roman concrete which is non reinforced low carbon concrete is one of the examples of problem solving that we are trying to achieve We have new materials such as coated reinforcement FRP and fiber reinforced concrete which can be used in any structural form To overcome this challenge with all our wisdom would be to live up to the feat the Romans accomplished 2 000 years ago Realizing highly durable and elegant structures with low carbon concrete is the key to meet the demands of the world in the future I hope you will enjoy reading this AOS brochure showing the Outstanding Concrete Structures Awards at the fib 2022 Congress in Oslo And I also hope you will find some clues for the challenges we are facing
