Ahmed, Amin Akhnoukh, Mona B. Anwar, Mahmoud El Khafif, Nagy Hanna, Amr T. Abdel Hamid, 2021-01-23 This book focuses on how to maintain environmental sustainability as one of its main principles and it addresses how smart cities serve to diminish wastes and maintain natural resources by having clean green energy that is operated by new smart technology designs Living in a smart city is not something of the future anymore it is here and it is being implemented all over the world A smart city uses different types of electronic Internet of things IoT sensors to collect data and then use these data to manage assets and resources efficiently The smart city concept integrates information and communication technology ICT and various physical devices connected to the IoT network to optimize the efficiency of city operations and services and achieve sustainable solutions to allow us to grow with proper management of our resources Smart sustainable structures and infrastructures face the need of urban areas due to the growth of populations while in the same time save our environment To achieve this we need to revisit the conventional methods in design and construction and the conventional materials which are used now to optimize the design and provide smart solutions In the past few years the consumption of resources has been massive and the waste produced from that consumption has been inconceivable This is causing environmental degradation which produces many environmental challenges such as global climate change excessive fossil fuel dependency and the growing demand for energy As well as discussing the challenges facing the civil engineering design and construction of smart cities components and presenting concepts and insight from experts and researchers from different civil engineering disciplines this book explains

Thus when Mario Paz, the editor of this handbook, asked me to write a Foreword, I was interested and honored by his request. Worldwide people are beginning to understand the severity of the danger to present and future generations caused by the destruction of the environment. Earthquakes pose a similar threat; thus the proper use of methods for earthquake resistant design and construction is vitally important for countries that are at high risk of being subjected to strong motion earthquakes. Most seismic activity is the result of tectonic earthquakes. Tectonic earthquakes are very special events in that although they occur frequently, their probability of becoming natural hazards for a specific urban area is very small. When a severe earthquake does occur near an urban area, however, its consequences are very large in terms of structural destruction and human suffering.      **Computational Methods in Earthquake Engineering** Manolis Papadrakakis, Michalis Fragiadakis, Nikos D. Lagaros, 2010-12-06 This book provides an insight in advanced methods and concepts for structural analysis and design against seismic loading. The book consists of 25 chapters dealing with a wide range of timely issues in contemporary Earthquake Engineering. In brief, the topics covered are: collapse assessment, record selection, effect of soil conditions, problems in seismic design, protection of monuments, earth dam structures and liquid containers, numerical methods, lifetime assessment, post-earthquake measures. A common ground of understanding is provided between the communities of Earth Sciences and Computational Mechanics towards mitigating seismic risk. The topic is of great social and scientific interest due to the large number of scientists and practicing engineers currently working in the field and due to the great social and economic consequences of earthquakes.      **Recent Advances in Earthquake Engineering** Sreevalsa Kolathayar, Siau Chen Chian, 2021-09-20 This book presents the select proceedings of the Virtual Conference on Disaster Risk Reduction VCDRR 2021.
