Transcryptfs Adarsh Jagannatha, 2013-06-11 TransCrypt is an encrypting filesystem indigenously developed at IIT Kanpur It has been under continuous development for the past 6 years by various students of IIT Kanpur at Prabhu Goel Research Centre for Computer and Internet Security The codebase of Transcryptfs filesystem for Linux is spread across various sub systems of Linux kernel viz dm layer lsm vfs crypto etc making it difficult to keep Transcryptfs updated with changes in any of those subsystem in upstream kernel s mainline code One of the main features of Transcryptfs for Linux file server is the use of Linux security module LSM for providing access control mechanism Due to changes in kernel architecture since late 2007 LSM has to be statically linked with kernel during its compile time thereby imposing a restriction that Transcryptfs supported kernel should be statically compiled with the Transcryptfs lsm module This additionally imposed restriction has led to a complicated procedure for setting up of Transcryptfs filesystem and also has shifted the responsibility of patching kernel with new updates from the distribution managers to individual system administrators These factors have resulted in non adoption of Transcryptfs for real world usecase In this thesis we re engineer and come up with an architecture that aims to make Transcryptfs an easily deployable and dynamically loadable kernel module in addition to decoupling codebase from the kernel source into a single manageable module thereby easing maintenance and further development of Transcryptfs filesystem The

contribution of this thesis is in designing the kernelspace architecture and related implementation of Transcryptfs as an out of the tree kernel module
