Degree Theory for Discontinuous Operators Rubén Figueroa Sestelo, Rodrigo López Pouso, Jorge Rodríguez López, 2021-09-21 This unique book contains a generalization of the Leray Schauder degree theory which applies for wide and meaningful types of discontinuous operators The discontinuous degree theory introduced in the first section is subsequently used to prove new applicable discontinuous versions of many classical fixed point theorems such as Schauder's Finally readers will find in this book several applications of those discontinuous fixed point theorems in the proofs of new existence results for discontinuous differential problems Written in a clear expository style with the inclusion of many examples in each chapter this book aims to be useful not only as a self contained reference for mature researchers in nonlinear analysis but also for graduate students looking for a guick accessible introduction to degree theory techniques for Optimal Control of Dynamic Systems Driven by Vector Measures N. León, 2025-03-14 In applications of stochastic calculus there are phenomena that cannot be analyzed through the classical It theory It is necessary therefore to have a theory based on stochastic integration with respect to these situations Theory of Stochastic Integrals aims to provide the answer to this problem by introducing readers to the study of some interpretations of stochastic integrals with respect to stochastic processes that are not necessarily semimartingales such as Volterra Gaussian processes or processes with bounded p variation among which we can mention fractional Brownian motion and Riemann Liouville fractional process Features Self contained treatment of the topic Suitable as a teaching or research tool for those interested in stochastic analysis and its applications Includes original results

Stochastic Calculus and Applications Samuel N. Cohen, Robert J. Introduction to Partial Differential Equations Peter J. Olver, 2013-11-08 This textbook is designed for a one year course covering the fundamentals of partial differential equations geared towards advanced undergraduates and beginning graduate students in mathematics science engineering and elsewhere The exposition carefully balances solution techniques mathematical rigor and significant applications all illustrated by numerous examples Extensive exercise sets appear at the end of almost every subsection and include straightforward computational problems to develop and reinforce new techniques and results details on theoretical developments and proofs challenging projects both computational and conceptual and supplementary material that motivates the student to delve further into the subject No previous experience with the subject of partial differential equations or Fourier theory is assumed the main prerequisites being undergraduate calculus both one and multi variable ordinary differential equations and basic linear algebra While the classical topics of separation of variables Fourier analysis boundary value problems Green s functions and special functions continue to form the core of an introductory course the inclusion of nonlinear equations shock wave dynamics symmetry and similarity the Maximum Principle financial models dispersion and solutions Huygens Principle quantum mechanical systems and more make this text well attuned to recent developments and trends in this active field of contemporary research Numerical approximation schemes are an important component of any introductory course and the text covers the two most basic approaches finite differences and finite elements Dynamics in One Non-Archimedean Variable Robert L. Benedetto, 2019-03-05 The theory

of complex dynamics in one variable initiated by Fatou and Julia in the early twentieth century concerns the iteration of a rational function acting on the Riemann sphere Building on foundational investigations of p adic dynamics in the late twentieth century dynamics in one non archimedean variable is the analogous theory over non archimedean fields rather than over the complex numbers It is also an essential component of the number theoretic study of arithmetic dynamics This textbook presents the fundamentals of non archimedean dynamics including a unified exposition of Rivera Letelier's classification theorem as well as results on wandering domains repelling periodic points and equilibrium measures The Berkovich projective line which is the appropriate setting for the associated Fatou and Julia sets is developed from the ground up as are relevant results in non archimedean analysis. The presentation is accessible to graduate students with only first year courses in algebra and analysis under their belts although some previous exposure to non archimedean fields such as the p adic numbers is recommended The book should also be a useful reference for more advanced students and researchers in arithmetic and non archimedean dynamics **Hardy Type Inequalities on Time Scales** Ravi P. Agarwal, Donal O'Regan, Samir H. Saker, 2016-10-20 The book is devoted to dynamic inequalities of Hardy type and extensions and generalizations via convexity on a time scale T In particular the book contains the time scale versions of classical Hardy type inequalities Hardy and Littlewood type inequalities Hardy Knopp type inequalities via convexity Copson type inequalities Copson Beesack type inequalities Liendeler type inequalities Levinson type inequalities and Pachpatte type inequalities Bennett type inequalities Chan type inequalities and Hardy type inequalities with two different weight functions These dynamic inequalities contain the classical continuous and discrete inequalities as special cases when T R and T N and can be extended to different types of inequalities on different time scales such as T hN h 0 T qN for q 1 etc In this book the authors followed the history and development of these inequalities Each section in self contained and one can see the relationship between the time scale versions of the inequalities and the classical ones To the best of the authors knowledge this is the first book devoted to Hardy typeinequalities and their extensions on time scales A Comprehensive Textbook on Metric **Spaces** Surinder Pal Singh Kainth, 2023-10-30 This textbook provides a comprehensive course in metric spaces Presenting a smooth takeoff from basic real analysis to metric spaces every chapter of the book presents a single concept which is further unfolded and elaborated through related sections and subsections Apart from a unique new presentation and being a comprehensive textbook on metric spaces it contains some special concepts and new proofs of old results which are not available in any other book on metric spaces It has individual chapters on homeomorphisms and the Cantor set This book is almost self contained and has an abundance of examples exercises references and remarks about the history of basic notions and results Every chapter of this book includes brief hints and solutions to selected exercises It is targeted to serve as a textbook for advanced undergraduate and beginning graduate students of mathematics Dynamic Network User Equilibrium Terry L. Friesz, Ke Han, 2023-08-07 This book presents advanced research in a relatively new field of scholarly

inquiry that is usually referred to as dynamic network user equilibrium now almost universally abbreviated as DUE It provides the first synthesis of results obtained over the last decade from applying the differential variational inequality DVI formalism to study the DUE problem In particular it explores the intimately related problem of dynamic network loading which determines the arc flows and effective travel delays or generalized travel costs arising from the expression of departure rates at the origins of commuter trips between the workplace and home In particular the authors show that dynamic network loading with spillback of queues into upstream arcs may be formulated as a differential algebraic equation system They demonstrate how the dynamic network loading problem and the dynamic traffic user equilibrium problem may be solved simultaneously rather than sequentially as well as how the first in first out queue discipline may be maintained for each when Lighthill Whitham Richardson traffic flow theory is used A number of recent and new extensions of the DVI based theory of DUE and corresponding examples are presented and discussed Relevant mathematical background material is provided to make the book as accessible as possible Random Matrices Alexei Borodin, Ivan Corwin, Alice Guionnet, 2019-10-30 Random matrix theory has many roots and many branches in mathematics statistics physics computer science data science numerical analysis biology ecology engineering and operations research This book provides a snippet of this vast domain of study with a particular focus on the notations of universality and integrability Universality shows that many systems behave the same way in their large scale limit while integrability provides a route to describe the nature of those universal limits Many of the ten contributed chapters address these themes while others touch on applications of tools and results from random matrix theory. This book is appropriate for graduate students and researchers interested in learning techniques and results in random matrix theory from different perspectives and viewpoints It also captures a moment in the evolution of the theory when the previous decade brought major break throughs prompting exciting new directions of Regularity for Orlicz Phase Problems Sumiya Baasandorj, Sun-Sig Byun, 2025-05-29 View the abstract research

The Statistical Mechanics of Interacting Walks, Polygons, Animals and Vesicles E. J. Janse van Rensburg, 2015-05-14 The self avoiding walk is a classical model in statistical mechanics probability theory and mathematical physics It is also a simple model of polymer entropy which is useful in modelling phase behaviour in polymers This monograph provides an authoritative examination of interacting self avoiding walks presenting aspects of the thermodynamic limit phase behaviour scaling and critical exponents for lattice polygons lattice animals and surfaces It also includes a comprehensive account of constructive methods in models of adsorbing collapsing and pulled walks animals and networks and for models of walks in confined geometries Additional topics include scaling knotting in lattice polygons generating function methods for directed models of walks and polygons and an introduction to the Edwards model This essential second edition includes recent breakthroughs in the field as well as maintaining the older but still relevant topics New chapters include an expanded presentation of directed models an exploration of methods and results for the hexagonal lattice and a chapter devoted to the
