pathogens and vaccines over a life time These are likely to have a long lasting effect on who and what we are and how we respond to further antigen challenge Therefore studies on how infection influences immune homeostasis and how the development of responses to a pathogen reflects what is known on immune regulation will be informative on how we can translate findings from our standard models into treatments usable in humans One organism allows us to do just this Bacteria of the genus Salmonella are devastating human pathogens Nevertheless many aspects of the diseases they cause can be successfully modelled in murine systems so that the infection is either resolving or non resolving This has the advantage of allowing the long term impact of infection on immune function to be assessed We propose to welcome key workers to write about their research that examine the consequence of Salmonella infection on the host and the elements of the bacterium that contribute to this
