Hardware/Software Co-Design and Co-Verification

Jean-Michel Bergé,Oz Levia,Jacques Rouillard,2013-03-09 Co Design is the set of emerging techniques which allows for the simultaneous design of Hardware and Software In many cases where the application is very demanding in terms of various performances time surface power consumption trade offs between dedicated hardware and dedicated software are becoming increasingly difficult to decide upon in the early stages of a design Verification techniques such as simulation or proof techniques that have proven necessary in the hardware design must be dramatically adapted to the simultaneous verification of Software and Hardware Describing the latest tools available for both Co Design and Co Verification of systems Hardware Software Co Design and Co Verification offers a complete look at this evolving set of procedures for CAD environments The book considers all trade offs that have to be made when co designing a system Several models are presented for determining the optimum solution to any co design problem including partitioning architecture synthesis and code generation When deciding on trade offs one of the main factors to be considered is the flow of communication especially to and from the outside world This involves the modeling of communication protocols An approach to the synthesis of interface circuits in the context of co design is presented Other chapters present a co design oriented flexible component data base and retrieval methods a case study of an ethernet bridge designed using LOTOS and co design methodologies and finally a programmable user interface based on monitors Hardware Software Co Design and Co Verification will help designers and researchers to

understand these latest techniques in system design and as such will be of interest to all involved in embedded system design

The Synthesis Approach to Digital System Design Petra Michel, Ulrich Lauther, Peter Duzy, 2012-12-06 Over the past decade there has been a dramatic change in the role played by design automation for electronic systems Ten years ago integrated circuit IC designers were content to use the computer for circuit logic and limited amounts of high level simulation as well as for capturing the digitized mask layouts used for IC manufacture The tools were only aids to design the designer could always find a way to implement the chip or board manually if the tools failed or if they did not give acceptable results Today however design technology plays an indispensable role in the design of electronic systems and is critical to achieving time to market cost and performance targets In less than ten years designers have come to rely on automatic or semi automatic CAD systems for the physical design of complex ICs containing over a million transistors In the past three years practical logic synthesis systems that take into account both cost and performance have become a commercial reality and many designers have already relinquished control of the logic netlist level of design to automatic computer aids To date only in certain well defined areas especially digital signal processing and telecommunications have higher level design methods and tools found significant success However the forces of time to market and growing system complexity will demand the broad based adoption of high level automated methods and tools over the next few years Models in System

Design Jean-Michel Bergé, Oz Levia, Jacques Rouillard, 2012-12-06 Models in System Design tracks the general trend in electronics in terms of size complexity and difficulty of maintenance System design is by nature combined with prototyping mixed domain design and verification and it is no surprise that today's modeling and models are used in various levels of system design and verification In order to deal with constraints induced by volume and complexity new methods and techniques have been defined Models in System Design provides an overview of the latest modeling techniques for use by system designers The first part of the book considers system level design discussing such issues as abstraction performance and trade offs There is also a section on automating system design The second part of the book deals with some of the newest aspects of embedded system design These include co verification and prototyping Finally the book includes a section on the use of the MCSE methodology for hardware software co design Models in System Design will help designers and researchers to understand these latest techniques in system design and as such will be of interest to all involved in embedded system design
