

# What Is The Difference Between Half-Wave And Full-Wave Rectification?

- Rectification is the process of converting alternating current (AC) to direct current (DC), primarily using two types: half-wave and full-wave rectifiers
- Half-wave rectifiers, being simple and inexpensive, use only one half of the AC waveform, resulting in poor voltage regulation, low efficiency, and a significant amount of ripple voltage
- Full-wave rectifiers, although more complex and slightly pricier, utilize both half-cycles of the AC waveform, leading to a smoother, continuous DC output with improved voltage regulation and efficiency
- Essentially, the choice between these rectifiers hinges on the trade-off between cost and performance

Handwritten notes comparing Full-Wave and Half-Wave Rectification:

- Full-Wave Rectification:**
  - One diode in the bridge conducts at any time.
  - Output voltage is not negative.
  - It means that output of positive is always there.
  - Efficiency is 81%.
- Half-Wave Rectification:**
  - One diode in the bridge conducts at any time.
  - Output voltage is not negative.
  - It means that output of positive is always there.
  - Efficiency is 40.6%.
- Full-Wave Bridge Rectifier:**
  - Four diodes.
  - Not used.
  - AC input to DC.
