Chapter 1 The Starting Point: Understanding the Scientific Method

1. Short answer: Describe characteristics and the role of different members of the termite society.

ANS:

The vast majority of members in a termite colony are wingless, sterile, and blind workers. They are milky white in color and possess hard-chewing mouth parts. Workers look after the eggs and nymphs, feed the soldiers and reproductive forms, build and maintain the colony, and forage for food. The workers are responsible for the telltale signs of termite damage. Soldiers are also wingless, sterile, and blind. This caste has a milky-white body with a yellowish-brown head and prominent mandibles. Soldiers defend the colony, mostly from ants. The reproductives, also called the royal caste, consist of the king and queen. Their only function is to reproduce. The royal caste is dark brown in color and has functional eyes. The queen seems to be striped because the segments of her abdomen are distended. Swarming termites are called alates or swarmers. They are winged reproductives that eventually establish new nests.

From X-rays to DNA W. David Lee, 2013-11-15 An argument that technology accelerates biological discovery with case studies ranging from chromosome discovery with early microscopes to how DNA replicates using radioisotope labels Engineering has been an essential collaborator in biological research and breakthroughs in biology are often enabled by technological advances Decoding the double helix structure of DNA for example only became possible after significant advances in such technologies as X ray diffraction and gel electrophoresis Diagnosis and treatment of tuberculosis improved as new technologies including the stethoscope the microscope and the X ray developed These engineering breakthroughs take place away from the biology lab and many years may elapse before the technology becomes available to biologists In this book David Lee argues for concurrent engineering the convergence of engineering and biological research as a means to accelerate the pace of biological discovery and its application to diagnosis and treatment He presents extensive case studies and introduces a metric to measure the time between technological development and biological discovery Investigating a series of major biological discoveries that range from pasteurization to electron microscopy Lee finds that it took an average of forty years for the necessary technology to become available for laboratory use Lee calls for new approaches to research and funding to encourage a tighter more collaborative coupling of engineering and biology Only then he argues will we see the rapid advances in the life sciences that are critically needed for life saving diagnosis and treatment
