

RESPIRATORY SYSTEM

The primary organs of the respiratory system are the lungs, which function to take in oxygen and expel carbon dioxide as we breathe.

GAS EXCHANGE PROCESS

is performed automatically by the lungs and respiratory system. How it works:

1. The air, containing oxygen and other gases, comes into the body through the lungs.
2. In the lungs, the oxygen is moved into the blood-stream and carried through the body.
3. Red blood cells collect the carbon dioxide and transport it back to the lungs, where it leaves the body when we exhale.

Alveoli

The exchange of oxygen and carbon dioxide occurs in the alveoli.
