Advances in Hybrid Rocket Technology and Related Analysis Methodologies

Carmine Carmicino, 2020-12-07. The book is an amazing collection of technical papers dealing with hybrid rockets. Once perceived as a niche technology for about a decade, hybrid rockets have enjoyed renewed interest from both the propulsion technical community and industry. Hybrid motors can be used in practically all applications where a rocket is employed, but there are certain cases where they present a superior fit, such as sounding rockets, tactical missile systems, launch boosters, and the emerging field of commercial space transportation. The novel space tourism business indeed will benefit from their safety and lower recurrent development costs. The subjects addressed in the book include the cutting edge technology employed to push forward this relatively new propulsion concept, spanning systems to improve fuel regression rate control, of the mixture ratio to optimize performance, computational fluid dynamics applied to the simulation of the internal ballistics, and some other novel system applications.

complex fuel grain structures as they burn This model must be easy to develop for any fuel grain geometry with the ability to model anything that is printable Current methods of geometric regression are either custom designed for each geometry or are slow and unstable mathematical simulations An alternative method proposed is to use image processing methods to regress a fuel grain This means all that is required to model the burnback of fuel grain geometry is a picture of a cross section of the fuel grain which is trivial to obtain from a CAD file or other sources This research will be an enabling technology for modeling new types of fuel grains that increase the performance of hybrid rocket motors allowing them to have more competitive performance against other chemical propulsion technologies
