On-Chip Inductance in High Speed Integrated Circuits Yehea I. Ismail, Eby G. Friedman, 2012-12-06 The appropriate interconnect model has changed several times over the past two decades due to the application of aggressive technology scaling New more accurate interconnect models are required to manage the changing physical characteristics of integrated circuits Currently RC models are used to analyze high resistance nets while capacitive models are used for less resistive interconnect However on chip inductance is becoming more important with integrated circuits operating at higher frequencies since the inductive impedance is proportional to the frequency The operating frequencies of integrated circuits have increased dramatically over the past decade and are expected to maintain the same rate of increase over the next decade approaching 10 GHz by the year 2012 Also wide wires are frequently encountered in important global nets such as clock distribution networks and in upper metal layers and performance requirements are pushing the introduction of new materials for low resistance interconnect such as copper interconnect already used in many commercial CMOS technologies On Chip Inductance in High Speed Integrated Circuits deals with the design and analysis of integrated circuits with a specific focus on on chip inductance effects It has been described throughout this book that inductance can have a tangible effect on current high speed integrated circuits For

example neglecting inductance and using an RC interconnect model in a production 0.25 μm CMOS technology can cause large errors over 35% in estimates of the propagation delay of on chip interconnect. It has also been shown that including inductance in the repeater insertion design process as compared to using an RC model improves the overall repeater solution in terms of area, power and delay with average savings of 40.8%, 15.6% and 6.7% respectively. On Chip Inductance in High Speed Integrated Circuits is full of design and analysis techniques for RLC interconnect. These techniques are compared to techniques traditionally used for RC interconnect design to emphasize the effect of inductance. On Chip Inductance in High Speed Integrated Circuits will be of interest to researchers in the area of high frequency interconnect noise and high performance integrated circuit design.

Integrated Circuit and System Design. Power and Timing Modeling, Optimization and Simulation Vassilis Paliouras, Johan Vounckx, Diederik Verkest, 2005-08-25. Welcome to the proceedings of PATMOS 2005, the 15th in a series of international workshops. PATMOS 2005 was organized by IMEC with technical co-sponsorship from the IEEE Circuits and Systems Society. Over the years PATMOS has evolved into an important European event where researchers from both industry and academia discuss and investigate the emerging challenges in future and contemporary applications, design methodologies and tools required for the development of upcoming generations of integrated circuits and systems. The technical program of PATMOS 2005 contained state of the art technical contributions, three invited talks, a special session on hearing aid design and an embedded tutorial. The technical program focused on timing performance and power consumption as well as architectural aspects with particular emphasis on modeling, design characterization, analysis and optimization in the nanometer era. The Technical Program Committee with the assistance of additional expert reviewers selected the 74 papers to be presented at PATMOS. The papers were divided into 11 technical sessions and 3 poster sessions. As is always the case with the PATMOS workshops, the review process was anonymous, full papers were required and several reviews were carried out per paper. Beyond the presentations of the papers, the PATMOS technical program was enriched by a series of speeches offered by world class experts on important emerging research issues of industrial relevance. Prof. Jan Rabaey (Berkeley, USA) gave a talk on "Traveling the Wild Frontier of Ultra Low Power Design". Dr. Sung Bae Park (Samsung) gave a presentation on "DVL: Deep Low Voltage Circuits and Devices". Prof. Through Silicon Vias Brajesh Kumar Kaushik, Vobulapuram Ramesh Kumar, Manoj Kumar Majumder, Arsalan Alam, 2016-11-30. Recent advances in semiconductor technology offer vertical interconnect access via that extend through silicon, popularly known as through silicon via (TSV). This book provides a comprehensive review of the theory behind TSVs while covering most recent advancements in materials, models and designs. Furthermore, depending on the geometry and physical configurations, different electrical equivalent models for Cu, carbon nanotube (CNT) and graphene nanoribbon (GNR) based TSVs are presented. Based on the electrical equivalent models, the performance comparison among the Cu, CNT and GNR based TSVs are also discussed.
