Resources in Education ,1985-07 **Basic and Applied Perspectives on Learning, Cognition, and Development** Charles A. Nelson, 2013-05-13 Although current views of cognitive development owe a great deal to Jean Piaget this field has undergone profound change in the years since Piaget s death This can be witnessed both in the influence connectionist and dynamical

system models have exerted on theories of cognition and language and in how basic work in cognitive development has begun to influence those who work in applied e.g. educational settings This volume brings together an eclectic group of distinguished experts who collectively represent the full spectrum of basic to applied aspects of cognitive development This book begins with chapters on cognition and language that represent the current Zeitgeist in cognitive science approaches to cognitive development broadly defined Following a brief commentary on this work the next section turns to more applied issues Although the focus here is on arithmetic learning the research programs described have profound implications for virtually all aspects of education and learning The last chapter views cognitive development from the perspective of ethology and evolutionary biology and in so doing provides a theoretical perspective that is novel and in some ways prescient specifically how can our views of cognition incorporate recent work in biology

Evolutionary Perspectives on Child Development and Education David C. Geary, Daniel B. Berch, 2016-04-26 This stimulating volume assembles leading scholars to address issues in children's cognitive academic and social development through the lens of evolutionary psychology Debates and controversies in the field highlight the potential value of this understanding from basic early learning skills through emerging social relationships in adolescence with implications for academic outcomes curriculum development and education policy Children's evolved tendency toward play and exploration fuels an extended discussion on child versus adult directed learning evolutionary bases are examined for young learners moral development and contemporary theories of learning and memory are viewed from an evolutionary perspective Along the way contributors recommendations illustrate real world uses of evolution based learning interventions during key developmental years Among the topics covered The adaptive value of cognitive immaturity applications of evolutionary developmental psychology to early education Guided play a solution to the play versus learning dichotomy Adolescent bullying in schools an evolutionary perspective Fairness what it isn't what it is and what it might be for Adapting evolution education to a warming climate of teaching and learning The effects of an evolution informed school environment on student performance and wellbeing Evolutionary Perspectives on Child Development and Education will interest researchers and graduate students working in diverse areas such as evolutionary psychology cultural anthropology human ecology developmental psychology and educational psychology Researchers in applied developmental science and early education will also find it useful

Advances in Child Development and Behavior, 2005-07-20 The Advances in Child Behavior and Development series has a well deserved reputation for publishing seminal articles that move established programs of developmental scholarship forward in creative new directions Consistent with this reputation the articles in Volume 33 of the series offer ground breaking work on topics as diverse as children's problem solving strategies intentionality mathematical reasoning and

socialization within and beyond school settings Although the substantive topics differ what unites the contributions are their uniformly high level of scholarship creativity theoretical sophistication and attention to developmental processes The volume is thus valuable not only to scholars with interests in the specialized topics covered in the articles but also to anyone interested in learning about developmental mechanisms and thus to anyone interested in promoting developmental outcomes in both cognitive and social domains Lynn S Liben Distinguished Professor of Psychology Pennsylvania State University USA Advances in Child Development and Behavior is designed to provide scholarly technical articles and speculation In these critical reviews recent advances in the field are summarized and integrated complexities are exposed and fresh viewpoints are offered Contributors are encouraged to criticize integrate and stimulate but always within a framework of high scholarship These reviews should be useful not only to the expert in the area but also to the general reader

Exploring Cognitive Development Alison F. Developing Cognitive Competence Tony J. Simon, Graeme S. Halford, 2015-05-15 Although computational modeling is now a widespread technique in cognitive science and in psychology relatively little work in developmental psychology has used this technique The approach is not entirely new as a small group of researchers has attempted to create computational accounts of cognitive developmental phenomena since the inception of the technique It should seem obvious that transition mechanisms or how the system progresses from one level of competence to the next ought to be the central question for investigation in cognitive developmental psychology Yet if one scans the literature of modern developmental studies it appears that the

question has been all but ignored. However, only recently have advances in computational technology enabled the researcher access to fully self-modifying computer languages capable of simulating cognitive change. By the beginning of the 1990s, increasing numbers of researchers in the cognitive sciences were of the opinion that the tools of mathematical modeling and computer simulation make theorizing about transition mechanisms both practical and beneficial by using both traditional symbolic computational systems and parallel distributed processing or connectionist approaches. Computational models make it possible to define the processes that lead to a system being transformed under environmental influence from one level of competence observed in children to the next most sophisticated level. By coding computational models into simulations of actual cognitive change, they become tangible entities that are accessible to systematic study. Unfortunately, little of what has been produced has been published in journals or books where many professionals would easily find them. Feeling that developmental psychologists should be exposed to this relatively new approach, a symposium was organized at the biennial meeting of the Society for Research in Child Development. The cost of entry was that speakers had to have a running computational model of a documented cognitive transition. Inspired by that conference, this volume is the first collection where each content chapter presents a fully implemented self-modifying simulation of some aspect of cognitive development. Previous collections have tended to discuss general approaches less than fully implemented models or non self-modifying models. Along with introductory and review chapters, this volume presents a set of truly developmental computational models, a collection that can inform the interested researcher as well as form the basis for graduate level courses.

Handbook of Child Development and Early Education Oscar A. Barbarin, Barbara Hanna Wasik, 2011-06-23. How and what should young children be taught? What emphasis should be given to emotional learning? How do we involve families? Addressing these and other critical questions, this authoritative volume brings together developmentalists and early educators to discuss what an integrated developmentally appropriate curriculum might look like across the preschool and early elementary years. State of the science work is presented on brain development and the emergence of cognitive, socioemotional, language, and literacy skills in 3 to 8 year olds. Drawing on experience in real world classrooms, contributors describe novel practical approaches to promoting school readiness, tailoring instruction to children's learning needs, and improving the teaching of language arts, math, and science.

Causal Learning Alison Gopnik, Laura Schulz, Laura Elizabeth Schulz, 2007-03-22. Understanding causal structure is a central task of human cognition. Causal learning underpins the development of our concepts and categories, our intuitive theories, and our capacities for planning, imagination, and inference. During the last few years, there has been an interdisciplinary revolution in our understanding of learning and reasoning. Researchers in philosophy, psychology, and computation have discovered new mechanisms for learning the causal structure of the world. This new work provides a rigorous formal basis for theory theories of concepts and cognitive development and, moreover, the causal learning mechanisms it has uncovered go dramatically beyond the traditional

mechanisms of both nativist theories such as modularity theories and empiricist ones such as association or connectionism
