

IDENTIFICATION OF UNKNOWN ORGANIC COMPOUNDS

Department of Chemistry, College of Science, Bicol University, Legazpi City

INTRODUCTION

The analysis and identification of unknown organic compounds constitutes a very important aspect of experimental organic chemistry. One could easily have an idea of what the unknown compound is, in cases such as chemical reactions. However, when a compound is isolated from a natural source, one may be left clueless as to what the compound can be. Discovering the identity of an unknown organic compound requires figuring out which functional groups it contains and determining its molecular structure.

The purpose of this laboratory activity was to identify the functional groups present in the given unknown, and eventually identify what organic compound the unknown is. In order to accomplish this, a variety of different tests were done. First, preliminary tests were conducted. Afterwards, solubility tests were run. Physical properties (density, melting point) were also determined. The results of the solubility tests can indicate the size and polarity of an unknown compound, which can narrow down the possible functional groups in the unknown. Once the options were narrowed, further classification tests were run. These tests were used to identify specific functional groups in the unknown sample.

METHODOLOGY

Preliminary tests were first conducted. The physical characteristics (physical state, color, odor) of the unknown was noted. An ignition test was also performed by heating a small amount of the unknown (about 0.1 g) on a metal spatula. The flame produced was observed (luminous or sooty).

After these preliminary tests, the solubility test was performed. First, 2mL of water was pipetted into a test tube and then a few crystals of the unknown were added. The solution was shaken. Solubility of the unknown was observed. If the unknown dissolved in water, the same procedure will be done but using ether as the solvent. If the unknown is insoluble in water, the solubility of the unknown will be tested with 5% NaOH. The next steps will be done according to the solubility flowchart (Figure 1) until it lands into a solubility class. The solubility of the unknown in the following reagents indicates the class of compound where it belongs and will be the basis of the classification tests to be conducted later on.

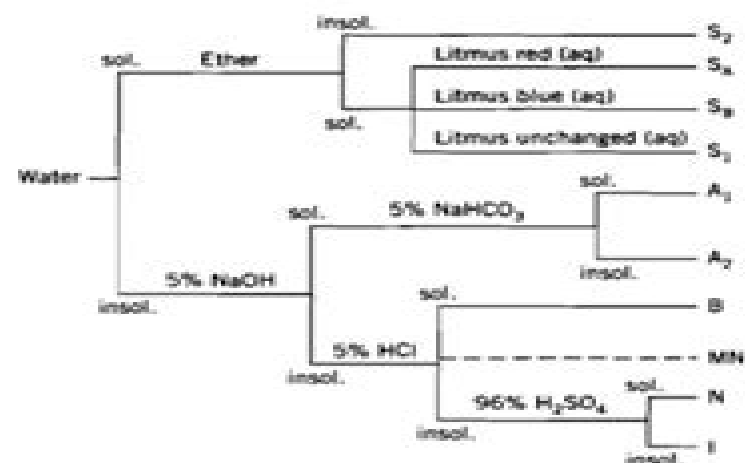

Figure 1. Classification of organic compounds by solubility (see Table 1 for compounds comprising each class). sol. = soluble; insol. = insoluble; litmus red is at pH below 4.5 and blue above 8.3.
