Paramecia are single-celled organisms that can survive in a wide range of salinities. However, we need quantitative evidence to show how their osmolarity compares with the surrounding salt solutions. I will compare osmolarity in both fluid environments to determine the fluid inside the paramecia.

Paramecia adjust to salinities that affect osmolarity by contracting or swelling. When multiple different groups of paramecia are tested at different salinities, the data shows that their measured osmolarity (measured against fluid) and osmolarity (measured in each group of paramecia) differ the salinity. (Table 1)

Table 1. Contractile Fluid Output by Paramecia Adapted to Different Salinities

Salinity of Environment (mM NaCl)	Contractile Fluid Output (mL per 100 cells)
0.0	0.0
0.5	0.5
1.0	1.0
1.5	1.5

1. **Paramecia** have a contractile fluid output that is directly related to the osmolarity of the environment. When the osmolarity is high, the contractile fluid output is low. When the osmolarity is low, the contractile fluid output is high. This shows that the contractile fluid output is directly related to the osmolarity of the environment.

The osmolarity of a solution determines the amount of water that moves in or out of the cell. When the osmolarity is high, the contractile fluid output is low. When the osmolarity is low, the contractile fluid output is high. This shows that the contractile fluid output is directly related to the osmolarity of the environment.

2. **Paramecia** have a contractile fluid output that is directly related to the osmolarity of the environment. When the osmolarity is high, the contractile fluid output is low. When the osmolarity is low, the contractile fluid output is high. This shows that the contractile fluid output is directly related to the osmolarity of the environment.

Robert Jones

3. **Paramecia** have a contractile fluid output that is directly related to the osmolarity of the environment. When the osmolarity is high, the contractile fluid output is low. When the osmolarity is low, the contractile fluid output is high. This shows that the contractile fluid output is directly related to the osmolarity of the environment.

4. **Paramecia** have a contractile fluid output that is directly related to the osmolarity of the environment. When the osmolarity is high, the contractile fluid output is low. When the osmolarity is low, the contractile fluid output is high. This shows that the contractile fluid output is directly related to the osmolarity of the environment.
