Foundations of Statistics for Data Scientists Alan Agresti, Maria Kateri, 2021-11-29 Foundations of

Statistics for Data Scientists With R and Python is designed as a textbook for a one or two term introduction to mathematical statistics for students training to become data scientists. It is an in depth presentation of the topics in statistical science with which any data scientist should be familiar including probability distributions, descriptive and inferential statistical methods and linear modeling. The book assumes knowledge of basic calculus so the presentation can focus on why it works as well as how to do it. Compared to traditional mathematical statistics textbooks, however, the book has less emphasis on probability theory and more emphasis on using software to implement statistical methods and to conduct simulations to illustrate key concepts. All statistical analyses in the book use R software with an appendix showing the same analyses with Python. Key Features: Shows the elements of statistical science that are important for students who plan to become data scientists. Includes Bayesian and regularized fitting of models e.g. showing an example using the lasso classification and clustering and implementing methods with modern software R and Python. Contains nearly 500 exercises. The book also introduces modern topics that do not normally appear in mathematical statistics texts but are highly relevant for data scientists such as Bayesian inference, generalized linear models for non normal responses e.g. logistic regression and Poisson loglinear models and regularized model fitting. The nearly 500 exercises are grouped into Data Analysis and Applications and Methods and Concepts. Appendices introduce R and Python and contain solutions for odd numbered exercises. The book's website <http://stat4ds.rwth-aachen.de> has expanded R, Python and Matlab appendices and all data sets from the examples and exercises.

Theory of Statistical Inference Anthony Almudevar, 2021-12-30. *Theory of Statistical Inference* is designed as a reference on statistical inference for researchers and students at the graduate or advanced undergraduate level. It presents a unified treatment of the foundational ideas of modern statistical inference and would be suitable for a core course in a graduate program in statistics or biostatistics. The emphasis is on the application of mathematical theory to the problem of inference leading to an optimization theory allowing the choice of those statistical methods yielding the most efficient use of data. The book shows how a small number of key concepts such as sufficiency, invariance, stochastic ordering, decision theory and vector space algebra play a recurring and unifying role. The volume can be divided into four sections. Part I provides a review of the required distribution theory. Part II introduces the problem of statistical inference. This includes the definitions of the exponential family, invariant and Bayesian models. Basic concepts of estimation, confidence intervals and hypothesis testing are introduced here. Part III constitutes the core of the volume presenting a formal theory of statistical inference. Beginning with decision theory, this section then covers uniformly minimum variance unbiased (UMVU) estimation, minimum risk equivariant (MRE) estimation and the Neyman-Pearson test. Finally, Part IV introduces large sample theory. This section begins with stochastic limit theorems, the method of the Bahadur representation theorem for sample quantiles, large sample U estimation, the Cramér-Rao lower bound and asymptotic efficiency. A separate chapter is then devoted to estimating equation methods. The volume ends with a detailed development of large sample hypothesis testing based on the likelihood ratio test.

LRT Rao score test and the Wald test Features This volume includes treatment of linear and nonlinear regression models ANOVA models generalized linear models GLM and generalized estimating equations GEE An introduction to decision theory including risk admissibility classification Bayes and minimax decision rules is presented The importance of this sometimes overlooked topic to statistical methodology is emphasized The volume emphasizes throughout the important role that can be played by group theory and invariance in statistical inference Nonparametric rank based methods are derived by the same principles used for parametric models and are therefore presented as solutions to well defined mathematical problems rather than as robust heuristic alternatives to parametric methods Each chapter ends with a set of theoretical and applied exercises integrated with the main text Problems involving R programming are included Appendices summarize the necessary background in analysis matrix algebra and group theory
