

Step 1 Identify the maximum and minimum values. The maximum height is 9 feet. The minimum height is 4 feet.

Step 2 Identify the vertical shift, k .

$$\begin{aligned}k &= \frac{(\text{maximum value}) + (\text{minimum value})}{2} \\&= \frac{9 + 4}{2} = \frac{13}{2} = 6.5\end{aligned}$$

Step 3 Decide whether the height should be modeled by a sine or cosine function. When $t = 0$, the height is at its minimum. So, use a cosine function whose graph is a reflection in the x -axis with no horizontal shift ($h = 0$).

Step 4 Find the amplitude and period.

The amplitude is

$$\begin{aligned}|a| &= \frac{(\text{maximum value}) - (\text{minimum value})}{2} \\&= \frac{9 - 4}{2} = 2.5.\end{aligned}$$

Because the graph is a reflection in the x -axis, $a < 0$.

So, $a = -2.5$. Because the flywheel is rotating at a rate of 1 revolution per 2 seconds, one revolution is completed in 2 seconds. So, the period is $\frac{2\pi}{b} = 2$, and $b = \pi$.

A model for the height of the handle is

$$h = -2.5 \cos \pi t + 6.5.$$

The Spatial Theory of Voting James M. Enelow, Melvin J. Hinich, 1984-04-27 This book provides an introduction to an important approach to the study of voting and elections the spatial theory of voting In contrast to the social psychological approach to studying voting behaviour the spatial theory of voting is premised on the idea of self interested choice Voters cast votes on the basis of their evaluation of the candidates or policy alternatives competing for their vote Candidates fashion their appeals to the voters in an effort to win votes The spatial theory provides explicit definitions for these behavioural assumptions to determines the form that self interested behaviour will take The consequences of this behaviour for the type of candidate or policy that voters will select is the major focus of the theory There is a twofold purpose to this work The first is to provide an elementary but rigorous introduction to an important body of political science research The second is to design and test a spatial theory of elections that provides insights into the nature of election contests The book will appeal to a wide audience since the mathematics is kept to an accessible level

Statistical Thinking from Scratch M. D. Edge, 2019-06-07 Researchers across the natural and social sciences find themselves navigating tremendous amounts of new data Making sense of this flood of information requires more than the rote application of formulaic statistical methods The premise of Statistical Thinking from Scratch is that students who want to become confident data analysts are better served by a deep introduction to a single statistical method than by a cursory overview of many methods In particular this book focuses on simple linear regression a method with close connections to the most important tools in applied statistics using it as a detailed case study for teaching resampling based likelihood based and Bayesian approaches to statistical inference Considering simple linear regression in depth imparts an idea of how statistical procedures are designed a flavour for the philosophical positions one assumes when applying statistics and tools to probe the strengths of one's statistical approach Key to the book's novel approach is its mathematical level which is gentler than most texts for statisticians but more rigorous than most introductory texts for non statisticians Statistical Thinking from Scratch is suitable for senior undergraduate and beginning graduate students professional researchers and practitioners seeking to improve their understanding of statistical methods across the natural and social sciences medicine psychology public health business and other fields
