Grandison, 2012-05-07 The second edition of the Food Processing Handbook presents a comprehensive review of technologies, procedures and innovations in food processing stressing topics vital to the food industry today and pinpointing the trends in future research and development. Focusing on the technology involved, this handbook describes the principles and the equipment used as well as the changes physical, chemical, microbiological and organoleptic that occur during food preservation. In so doing, the text covers in detail such techniques as post harvest handling, thermal processing, evaporation and dehydration, freezing, irradiation, high pressure processing, emerging technologies and packaging. Separation and conversion operations widely used in the food industry are also covered as are the processes of baking, extrusion and frying. In addition, it addresses current concerns about the safety of processed foods including HACCP systems, traceability and hygienic design of plant and control of food processes as well as the impact of processing on the environment, water and waste treatment, lean manufacturing and the roles of nanotechnology and fermentation in food processing. This two volume set is a must have for scientists and engineers involved in food manufacture, research and development in both industry and academia as well as students of food related topics at undergraduate and postgraduate levels. From Reviews on the First Edition: This work should become a standard text for students of food technology and is worthy of a place on the bookshelf of anybody involved in the production of foods. *Journal of Dairy Technology*, August 2008. This work will serve well as an excellent course resource or reference as it has well written explanations for those new to the field and detailed equations for those needing greater depth. *CHOICE*, September 2006. **Mechanics of Machines** Viswanatha Ramamurti, 2002 Industries that use machines in their day to day operations include power, automobile, steel and chemical plants, sectors to mention just a few. As these industries' services evolve, their machines must also evolve. To design these machines, you must understand both their performance requirements and the physical concepts governing their motion. Emphasizing the industrial relevance of the subject matter, *Mechanics of Machines* provides the fundamental information students need to decide on the criteria for designing new machines and for analyzing the root cause of problems arising out of malfunctioning of existing equipment.

Cogeneration in the Cane Sugar Industry J.H. Payne, 2012-12-02 The cane plant is probably the most efficient utilizer of sun energy for food production and at the same time provides an equivalent quantity of biomass. The purpose of this book is to set down the unique position of sugar cane in the cogeneration field. Simultaneous with the development of distance transmission of electricity, sugar cane processors started cogeneration, making use of the cane plant to supply the power for its own processing and in recent years, excess power for export. A broad view of cogeneration in the cane industry, covering

the energy available in a crop the technology of processing for optimum recovery of energy as well as sugar is presented here The book describes the most practicable processes for recovering energy in the form of process steam and electricity Cogeneration in the Cane Sugar Industry should be of interest to a broad spectrum including government agencies biomass interests power generators public utilities as well as sugar producers and technologist Cane Sugar Manufacture in India D. P. Kulkarni,1996 Food Properties and Computer-Aided Engineering of Food Processing Systems R.P. Singh, Augusto G. Medina,2012-12-06 Food properties whether they concern the physical thermodynamic chemical nutritional or sensory characteristics of foods play an important role in food processing In our quest to gain a mechanistic understanding of changes occurring during food processing the knowledge of food properties is essential Quantitative information on the food properties is necessary in the design and operation of food processing equipment Foods because of their biological nature and variability vary in the magnitude of their properties The variation in properties offer a challenge both in their measurement and use in the food processing applications Often a high level of precision in measurement of properties is not possible as the measurement method may itself cause changes to the product resulting in a variation in the obtained values Recognizing the difficulties in measurement of food properties and the lack of completeness of such information several research programs have been in existence during the last two decades In Europe a multinational effort has been underway since 1978 The first project supported by COST European Cooperation in the Field of Scientific and Technical Research was titled COST 90 The Effect of Processing on the Physical Properties of Foodstuffs This and another project COST 90bis have considerably added to our knowledge of measurement methods and data on a number of physical properties Two publications that summarize the work conducted under 1 2 these projects are Physical Properties of Foods and Physical Properties of Foods **The Cumulative Book Index** ,1988 A world list of books in the English language **Phase Transitions in Foods** Yrjo H Roos,Stephan Drusch,2015-10-05 Phase Transitions in Foods Second Edition assembles the most recent research and theories on the topic describing the phase and state transitions that affect technological properties of biological materials occurring in food processing and storage It covers the role of water as a plasticizer the effect of transitions on mechanical and chemical changes and the application of modeling in predicting stability rates of change The volume presents methods for detecting changes in the physical state and various techniques used to analyze phase behavior of biopolymers and food components It should become a valuable resource for anyone involved with food engineering processing storage and quality as well as those working on related properties of pharmaceuticals and other biopolymers Contains descriptions of non fat food solids as biopolymers which exhibit physical properties that are highly dependent on temperature time and water content Details the effects of water on the state and stability of foods Includes information on changes occurring in state and physicochemical properties during processing and storage The only book on phase and state transitions written specifically for the applications in food industry product development and research Modern Energy Economy in Beet Sugar Factories

K. Urbaniec, 2013-10-22 This book is devoted to the problems of identifying the potential for designing and implementing energy saving measures in beet sugar factories. As the sugar industries in various countries differ considerably with respect to the economic conditions for factory operation and the level of technological development, the problem range is very broad. It may include the elimination of faulty or unreliable auxiliary equipment or the introduction of simple improvements in vapour distribution schemes in factories operated in countries where the need for efficient energy utilization has not really been very urgent until now. On the other hand, there are sugar factories in some other countries where considerable achievements have been made in energy saving but where further progress may still be possible if more advanced engineering problems are solved. The author takes an interdisciplinary approach to its subject aimed at demonstrating how the energy demand of a sugar factory can be affected by the interactions between a number of factors, namely layout and parameters of the energy conversion and distribution processes, layout and parameters of the sugar manufacturing process and by processes characteristics of the equipment and control systems, completeness and accuracy of the energy monitoring systems. The book consists essentially of three parts. In Chapters 1 to 3, some theoretical background is given and engineering principles for creating efficient energy conversion and utilization subsystems in sugar factories are reviewed. The second part, Chapters 4 to 7, discusses recent developments in these areas and their importance to energy conversion and utilization in sugar factories. The presentation is illustrated with suitable, practically oriented examples based mostly on the author's experience gained from nine years working with an engineering company specializing in the design, erection and modernization of sugar factories as well as five years of consulting and research for the sugar industry. Short examples are presented in Chapters 1, 2, 3 and 7, while in the third part of the book, Chapters 8 and 9, summaries are given of real life design analyses of energy subsystems of sugar factories characterized by different levels of sophistication of the energy economy. The book thus provides a systematic review which will be helpful to managers and technologists in sugar factories where the problem may arise of choosing the most appropriate set of measures that best fit the factory's unique needs. It can also be used in university level courses on the energy economy of sugar factories and will be of interest to design engineers and specialists engaged in research in the area.
