Microstrip Filters for RF / Microwave Applications Jia-Sheng Hong, 2011-01-06 The first edition of Microstrip Filters for RF Microwave Applications was published in 2001 Over the years

the book has been well received and is used extensively in both academia and industry by microwave researchers and engineers. From its inception as a manuscript the book is almost 8 years old. While the fundamentals of filter circuits have not changed, further innovations in filter realizations and other applications have occurred with changes in the technology and use of new fabrication processes such as the recent advances in RF MEMS and ferroelectric films for tunable filters, the use of liquid crystal polymer (LCP) substrates for multilayer circuits, as well as the new filters for dual band, multi band, and ultra wideband (UWB) applications. Although the microstrip filter remains as the main transmission line medium for these new developments, there has been a new trend of using combined planar transmission line structures such as co planar waveguide (CPW) and slotted ground structures for novel physical implementations beyond the single layer in order to achieve filter miniaturization and better performance. Also over the years practitioners have suggested topics that should be added for completeness or deleted in some cases as they were not very useful in practice. In view of the above, the authors are proposing a revised version of the *Microstrip Filters for RF Microwave Applications* text and a slightly changed book title of *Planar Filters for RF Microwave Applications* to reflect the aforementioned trends in the revised book.

Smart Antennas
T. K. Sarkar, Michael C. Wicks, Magdalena Salazar-Palma, Robert J. Bonneau, 2005-02-18. A valuable addition to the Wiley Series in Microwave and Optical Engineering. Today's modern wireless mobile communications depend on adaptive smart antennas to provide maximum range and clarity. With the recent explosive growth of wireless applications, smart antenna technology has achieved widespread commercial and military applications. The only book available on the topic of adaptive antennas using digital technology, this text reflects the latest developments in smart antenna technology and offers timely information on fundamentals as well as new adaptive techniques developed by the authors. Coupling electromagnetic aspects of antenna design with signal processing techniques designed to promote accurate and efficient information exchange, the text presents various mechanisms for characterizing signal path loss associated with signal propagation, particularly for mobile wireless communications systems based on such techniques as joint space frequency adaptive processing. In clear, accessible language, the authors explain the difference between adaptive antennas and adaptive signal processing. Illustrate the procedures for adaptive processing using directive elements in a conformal array, clarify multistage analysis procedure which combines electromagnetic analysis with signal processing, present a survey of the various models for characterizing radio wave propagation in urban and rural environments, describe a method wherein it is possible to identify and eliminate multipath without spatial diversity, optimize the location of base stations in a complex environment. The text is an excellent resource for researchers and engineers working in electromagnetics and signal processing who deal with performance improvement of adaptive techniques, as well as those who are concerned with the characterization of propagation channels and applications of airborne phased arrays.
