Behavioral Program Synthesis with Genetic Programming Krzysztof Krawiec, 2015-12-15

Genetic programming GP is a popular heuristic methodology of program synthesis with origins in evolutionary computation In this generate and test approach candidate programs are iteratively produced and evaluated The latter involves running programs on tests where they exhibit complex behaviors reflected in changes of variables registers or memory That behavior not only ultimately determines program output but may also reveal its hidden qualities and important characteristics of the considered synthesis problem However the conventional GP is oblivious to most of that information and usually cares only about the number of tests passed by a program This evaluation bottleneck leaves search algorithm underinformed about the actual and potential qualities of candidate programs This book proposes behavioral program synthesis a conceptual framework that opens GP to detailed information on program behavior in order to make program synthesis more efficient Several existing and novel mechanisms subscribing to that perspective to varying extent are presented and discussed including implicit fitness sharing semantic GP co solvability trace convergence analysis pattern guided program synthesis and behavioral archives of subprograms The framework involves several concepts that are new to GP including execution record combined trace and search driver a generalization of objective function Empirical evidence gathered in several presented experiments clearly demonstrates the usefulness of behavioral approach The book contains also an extensive discussion of implications of the behavioral perspective for program synthesis and beyond
