An Introduction To Financial Option Valuation Mathematics Stochastics And Computation:

An Introduction to Financial Option Valuation Desmond J. Higham, 2004-04-15 This is a lively textbook providing a solid introduction to financial option valuation for undergraduate students armed with a working knowledge of a first year calculus. Written in a series of short chapters its self contained treatment gives equal weight to applied mathematics, stochastics and computational algorithms. No prior background in probability statistics or numerical analysis is required. Detailed derivations of both the basic asset price model and the Black Scholes equation are provided along with a presentation of appropriate computational techniques including binomial finite differences and in particular variance reduction techniques for the Monte Carlo method. Each chapter comes complete with accompanying stand alone MATLAB code listing to illustrate a key idea. Furthermore the author has made heavy use of figures and examples and has included computations based on real stock market data.

Applied Stochastic Processes and Control for Jump-Diffusions Floyd B. Hanson, 2007-01-01 This self contained practical entry level text integrates the basic principles of applied mathematics, applied probability and computational science for a clear presentation of stochastic processes and control for jump diffusions in continuous time. The author covers the important problem of controlling these systems and through the use of a jump calculus construction discusses the strong role of discontinuous and nonsmooth properties versus random properties in stochastic systems.

Numerical Solution of Stochastic Differential Equations with Jumps in Finance Eckhard Platen, Nicola Bruti-Liberati, 2010-07-23 In financial and actuarial modeling and other areas of application stochastic differential equations with jumps have been employed to describe the dynamics of various state variables. The numerical solution of such equations is more complex than that of those only driven by Wiener processes described in Kloeden Platen Numerical Solution of Stochastic Differential Equations 1992. The present monograph builds on the above mentioned work and provides an introduction to stochastic differential equations with jumps in both theory and application emphasizing the numerical methods needed to solve such equations. It presents many new results on higher order methods for scenario and Monte Carlo simulation including implicit predictor corrector extrapolation, Markov chain and variance reduction methods stressing the importance of their numerical stability. Furthermore it includes chapters on exact simulation, estimation and filtering. Besides serving as a basic text on quantitative methods it offers ready access to a large number of potential research problems in an area that is widely applicable and rapidly expanding. Finance is chosen as the area of application because much of the recent research on stochastic numerical methods has been driven by challenges in quantitative finance. Moreover the volume introduces readers to the modern benchmark approach that provides a general framework for modeling in finance and insurance beyond the standard risk neutral approach. It requires undergraduate background in mathematical or quantitative methods, is accessible to a broad

readership including those who are only seeking numerical recipes and includes exercises that help the reader develop a deeper understanding of the underlying mathematics

Mathematical Models, Methods and Applications Abul Hasan Siddiqi, Pammy Manchanda, Rashmi Bhardwaj, 2015-12-14 The present volume contains invited talks of 11th biennial conference on Emerging Mathematical Methods Models and Algorithms for Science and Technology The main message of the book is that mathematics has a great potential to analyse and understand the challenging problems of nanotechnology biotechnology medical science oil industry and financial technology The book highlights all the features and main theme discussed in the conference All contributing authors are eminent academicians scientists researchers and scholars in their respective fields hailing from around the world

American-Type Options Dmitrii S. Silvestrov, 2013-11-27 The book gives a systematical presentation of stochastic approximation methods for models of American type options with general pay off functions for discrete time Markov price processes Advanced methods combining backward recurrence algorithms for computing of option rewards and general results on convergence of stochastic space skeleton and tree approximations for option rewards are applied to a variety of models of multivariate modulated Markov price processes The principal novelty of presented results is based on consideration of multivariate modulated Markov price processes and general pay off functions which can depend not only on price but also an additional stochastic modulating index component and use of minimal conditions of smoothness for transition probabilities and pay off functions compactness conditions for log price processes and rate of growth conditions for pay off functions The book also contains an extended bibliography of works in the area This book is the first volume of the comprehensive two volumes monograph The second volume will present results on structural studies of optimal stopping domains Monte Carlo based approximation reward algorithms and convergence of American type options for autoregressive and continuous time models as well as results of the corresponding experimental studies
