Anti Lock Braking System Abs And Anti Slip Regulation Asr:

A Framework for Automated HW/SW Co-Verification of SystemC Designs Using Timed Automata Paula

Herber,2010 In this dissertation we present a systematic comprehensive and formally founded quality assurance process which allows automated co verification of digital hardware software systems that are modeled in SystemC The main idea is to apply model checking to verify that an abstract design meets a requirements specification and to generate conformance tests to check whether refined designs conform to this abstract design As formal foundation we define a formal semantics of SystemC by a transformation into the well defined semantics of UPPAAL timed automata The automatically generated timed automata model can be verified using the UPPAAL model checker and it can be used to generate conformance tests With that we obtain guarantees about liveness safety and timing properties of the abstract design which serves as a specification and we can ensure the consistency of each refined design to that The result is a HW SW co verification flow that supports the HW SW co development process continuously from abstract design down to the implementation The complete verification flow is implemented in our Framework for the Verification of SystemC designs using Timed Automata VeriSTA and its applicability and performance are shown by experimental results
