Cytotoxic Drug Resistance Mechanisms Robert Brown, Uta Böger-Brown, 2008-02-01 There is now a range of cytotoxic drugs that have considerable clinical usefulness in producing responses in tumors and even in a small proportion of cases cure However the acquisition of drug resistance is a major clinical problem and is perhaps the main limiting factor in successful treatment of cancer Thus a tumor initially sensitive to chemotherapy will in the majority of cases eventually recur as a resistant tumor which will then progress Much of our understanding of drug resistance mechanisms comes from the study of tumor cell lines grown in tissue culture We now understand many of the molecular mechanisms that can lead to a cell acquiring resistance to anticancer drugs however we still do not know which mechanisms are those most relevant to the problem of clinical drug resistance Indeed given that many of the cytotoxic anticancer drugs were discovered by random screening it is clear what features give a clinically useful anticancer drug a sufficient therapeutic index to be of value The aim of Cytotoxic Drug Resistance Mechanisms is to provide protocols that are appropriate for examining the mechanisms of cellular resistance to anticancer cytotoxics in human tumor samples Tumor cell lines have been enormously useful as experimental models of drug resistance mechanisms however they have limitations and we need to address the relevance of such mechanisms in patients tumors Examining drug resistance in tumors is much more problematic than in cell lines
