

All answers should be found in workbook or IAN (interactive notebook).

1. Know the following terms: (most are included in the crossword)

Weathering, erosion, mechanical weathering, abrasion, ice wedging, chemical weathering, oxidation, acid rain, permeable, bedrock, humus, soil, fertility, loam, soil horizon, topsoil, subsoil, litter, decomposers, sod, natural resource, Dust Bowl, soil conservation, contour plowing, conservation plowing, crop rotation

2. What is the difference between weathering and erosion? Weathering is the breaking down of rock and erosion is the movement of rock particles
3. 5 causes of mechanical weathering: Abrasion, plant growth, release of pressure, animal actions, ice wedging/freezing and thawing
4. 5 causes of chemical weathering: Water, oxygen, carbon dioxide, living organisms, acid rain
5. Factors that affect the rate of weathering—in which type of climate would you expect to find more weathering? Which rock weathers faster? Climate and type of rock; wet and warm/hot climate would have more weathering; marble weathers faster than granite
6. 5 components of soil: Rock particles, minerals, decayed organic material, water and air
7. How does soil form? Which layer forms first? Which layer forms next? Which layer forms last? When rock is exposed, it can be weathered; weathered bedrock is the first step—this is horizon C; then seeds get dropped between the sediment and begin to sprout; over time these plants decay and return their nutrients to the soil, creating the topsoil, or horizon A; after years of more and more topsoil, the subsoil is formed as clay and other particles are washed down from the topsoil—this is horizon B
8. How do scientists classify the type of soil? Climate, type of plants, and soil composition
9. What soil type is where we live? Be able to recognize other soil types. Southern forest soil; tundra, mountain, prairie, desert
10. What is the role of living organisms in the soil? Some burrow and make spaces for air and water; others mix the soil; and decomposers break down the organic matter to return nutrients to the soil
11. List some organisms involved in the formation of soil. Earthworms, chipmunks, mice, bacteria, fungi, insects, plant roots, leaves and stems...
12. Why is soil a natural resource? All living things depend on it for survival
13. How does soil lose its fertility? By planting too much of the same crop, depleting (or using up) the soil's nutrients
14. Who was George Washington Carver? Scientist who worked with farmers and promoted soil conservation (he also encouraged them to grow peanuts to replenish the nutrients in the soil—he experimented with peanuts and other crops to find many uses for the farmers' crops)
15. What happened during the Dust Bowl? Plants had been plowed, exposing the soil; drought dried it up, and wind storms blew it away—it taught us the value of conserving the soil

Soil Conservation Service, 1985 *Ecosystem Biogeochemistry* Christopher S. Cronan, 2017-10-05 This textbook presents a comprehensive process oriented approach to biogeochemistry that is intended to appeal to readers who want to go beyond a general exposure to topics in biogeochemistry and instead are seeking a holistic understanding of the interplay of biotic and environmental drivers in the cycling of elements in forested watersheds The book is organized around a core set of ecosystem processes and attributes that collectively help to generate

the whole system structure and function of a terrestrial ecosystem In the first nine chapters a conceptual framework is developed based on distinct soil microbial plant atmospheric hydrologic and geochemical processes that are integrated in the element cycling behavior of watershed ecosystems With that conceptual foundation in place students then proceed to the final three chapters where they are challenged to think critically about integrated element cycling patterns roles for biogeochemical models the likely impacts of disturbance stress and management on watershed biogeochemistry and linkages among patterns and processes in watersheds experiencing novel environmental changes Included with the text are figures tables of comparative data extensive literature citations a glossary of terms an index and a set of 24 biogeochemical problems with answers The problems are intended to support chapter concepts and to demonstrate how critical thinking skills simple algebra and thoughtful human logic can be used to solve applied problems in biogeochemistry that might be encountered by a research scientist or a resource manager Using this book as an introduction to biogeochemistry students will achieve a level of subject mastery and disciplinary perspective that will permit them to see and to interpret the individual components interactions and synergies that are represented in the dynamic element cycling patterns of watershed ecosystems
