Int. du Béton, 2016 This document has a broad scope and is not focussed on design issues Precast construction under seismic

conditions is treated as a whole The main principles of seismic design of different structural systems their behavior and their construction techniques are presented through rules construction steps and sequences procedures and details that should lead to precast structures built in seismic areas complying with the fundamental performance requirements of collapse prevention and life safety in major earthquakes and limited damage in more frequent earthquakes The content of this document is largely limited to conventional precast construction and although some information is provided on the well known PRESSS technology jointed ductile dry connections this latter solution is not treated in detail in this document The general overview contained in this document of alternative structural systems and connection solutions available to achieve desired performance levels intends to provide engineers architects clients and end users in general with a better appreciation of the wide range of applications that modern precast concrete technology can have in various types of construction from industrial to commercial as well as residential Lastly the emphasis on practical aspects from conceptual design to connection detailing aims to help engineers to move away from the habit of blindly following prescriptive codes in their design but instead go back to basic principles in order to achieve a more robust understanding and thus control of the seismic behaviour of the structural system as a whole as well as of its components and individual connections

**Applied Mechanics Reviews**, 1974      **Modern Structural Analysis** Iain Alasdair MacLeod, 2005 In the past the main difficulties in structural analysis lay in the solution process now model development is a fundamental issue This work sets out the basic principles for structural analysis modelling and discusses basic processes for using modern software

**Strengthening of Reinforced Concrete Structures** L C Hollaway, M Leeming, 1999-03-05 The in situ rehabilitation or upgrading of reinforced concrete members using bonded steel plates is an effective convenient and economic method of improving structural performance However disadvantages inherent in the use of steel have stimulated research into the possibility of using fibre reinforced polymer FRP materials in its place providing a non corrosive more versatile strengthening system This book presents a detailed study of the flexural strengthening of reinforced and prestressed concrete members using fibre reinforced polymer composite plates It is based to a large extent on material developed or provided by the consortium which studied the technology of plate bonding to upgrade structural units using carbon fibre polymer composite materials The research and trial tests were undertaken as part of the ROBUST project one of several ventures in the UK Government's DTI LINK Structural Composites Programme The book has been designed for practising structural and civil engineers seeking to understand the principles and design technology of plate bonding and for final year undergraduate and postgraduate engineers studying the principles of highway and bridge engineering and structural engineering Detailed study of the flexural strengthening of reinforced and prestressed concrete members using fibre reinforced polymer composites Contains in depth case histories
