Abstract—An SQL Injection attack is a database focused attack for programmes that utilize data. It is accomplished by inserting malicious lines of code into the SQL query to alter and modify its meaning, allowing the attacker to gain access to the database or retrieve sensitive data. Many strategies for detecting and preventing such assaults have been developed and suggested. This study provides an in-depth examination of 38 publications on approaches for detecting SQL Injection in web applications. This offers a foundation for designing and using efficient SQL Injection, detection and prevention techniques.

Keywords—SQL injection attacks, SQLi detection, SQLi mitigation, SQLi prevention, Web-application attacks, database attacks.

I. INTRODUCTION

Structured Query Language (SQL) is a standardized programming language used to manage relational databases and perform various operations on the data in them. It employs statements, which are groups of keywords used to obtain data from databases.

It would take substantially longer to find the data you want if you navigated a huge database without SQL. Instead of spending a great amount of time searching manually, you can use the SELECT statement to immediately locate datasets that fulfil all of the conditions of your search. The INSERT statement inserts new data into tables. Existing records can be deleted using the DELETE command. To create a new database in your database management system, we use CREATE DATABASE command and it is the initial step in setting up your database. Similarly, after the database has been formed, the CREATE TABLE command generates a new table. The UPDATE statement modifies one or more database records.

SQL is anticipated to be used in applications like Spotify, Revolut, banking apps, and other social networking sites like Twitter and Instagram, in addition to Facebook. DDL (Data Definition Language), DML (Data Manipulation Language),

DCL (Data Control Language), and DQL (Data Query Language) are the four different types of SQL commands that make up the language.

A hacker will use SQLi to try to input specially designed SQL queries into a form field instead of the desired data [1]. The goal is to get a response back from the database that will aid the hacker in comprehending how the database is made, such as table names. Fig. 1 illustrates how the offline training step and the online testing stage are crucial components of the SQLi detection approach.

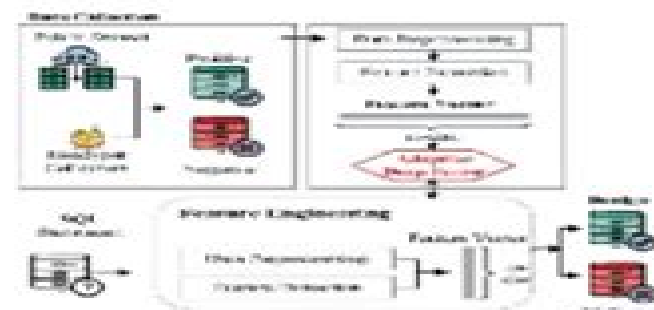

Fig. 1. SQL Model Execution and Application [2]

Huang and colleagues [3] recommend WAVES, a black-box technique, for analysing web applications for SQLi vulnerabilities. The software finds every possible point of entry into web application for SQLi. It creates attacks that target particular regions explicitly and then uses machine learning to monitor how the application responds to these assaults [4]. The process of detection and prevention is difficult, but it is made easier if one has a good understanding of the many types
