**Magnetic Resonance Imaging of Healthy and Diseased Brain Networks** Yong He, Alan Evans, 2015-03-05 An important aspect of neuroscience is to characterize the underlying connectivity patterns of the human brain i.e. human connectomics Over the past few years researchers have demonstrated that by combining a variety of different neuroimaging technologies e.g. structural MRI diffusion MRI and functional MRI with sophisticated analytic strategies such as graph theory it is possible to noninvasively map the patterns of structural and functional connectivity of human whole brain networks With these novel approaches many studies have shown that human brain networks have nonrandom properties such as modularity small worldness and highly connected hubs Importantly these quantifiable network properties change with age learning and disease Moreover there is growing evidence for behavioral and genetic correlates Network analysis of neuroimaging data is opening up a new avenue of research into the understanding of the organizational principles of the brain that will be of interest for all basic scientists and clinical researchers Such approaches are powerful but there are a number of challenging issues when extracting reliable brain networks from various imaging modalities and analyzing the topological properties e.g. definitions of network nodes and edges and reproducibility of network analysis We assembled contributions related to the state of the art methodologies of brain connectivity and the applications involving development aging and neuropsychiatric disorders such as Alzheimer's disease schizophrenia attention deficit hyperactivity disorder and mood and anxiety disorders It is anticipated that the articles in this Research Topic will provide a greater range and depth of provision for the field of imaging connectomics

**Sub- and Supra-Second Timing: Brain, Learning and Development** Lihan Chen, Yan Bao, Marc Wittmann, 2016-08-15 Time perception in the range of milliseconds to a few seconds is essential for many important sensory and perceptual tasks including speech perception motion perception motor coordination and cross modal interaction For the brain to be in synchrony with the environment the physical differences in the speeds of light and sound as well as stimuli from other modalities such as odors must be processed and coordinated P. Bao et al 2015 Time is a subjective feeling that is modulated by emotional states which trigger temporal distortions temporal dilation vs contraction Wittmann et al 2014 hence give rise to subjective time that may be different to event time as initially registered in the brain

Recent research suggests that time perception in a multisensory world is subject to prior task experience and shaped by statistical learning processes. Humans are active learners. That is, the engagement of the own body in a timing task within a perceptual action loop will make a noticeable difference in timing performance as compared to when humans only passively perceive the same perceptual scenario (Bao et al 2015; Chen & Vroomen 2013). This Research Topic of Sub and Supra Second Timing: Brain Learning and Development has integrated sixteen submissions of novel research on sub and supra timing. We have categorized the papers in this topic into the following four themes from which we can deduce trends of research about multisensory timing in the sub and supra second range: Sensory timing interaction and reliability; Adaptive representation of time learning and temporal prediction; Sensorimotor synchronization, embodiment and coordination; Perspective of psychological moment and temporal organization. Overall, the collections in Sub and Supra Second Timing: Brain Learning and Development show some recent trends and debates in multisensory timing research as well as provide a venue to inspire future work in multisensory timing.
