High-Performance Energy-Efficient Microprocessor Design Vojin G. Oklobdzija,Ram K. Krishnamurthy,2007-04-27 Microprocessors of today contain close to a billion transistors while achieving the performance of super computers just a decade ago Designing such processors takes hundreds of people organized into large teams High Performance Energy Efficient Microprocessor Design is written by the world s most prominent microprocessor design leaders from the industry and academia It provides a complete coverage of all the aspects of a complex microprocessor design process from technology power management clocking high performance architecture design methodologies memory and I O design computer aided design testing and design for testability The chapters are written to provide the latest state of the art knowledge of particular aspects of microprocessor design while including sufficient tutorial content in order to bring non experts up to speed High Performance Energy Efficient Microprocessor Design is intended to be a useful companion book for every design engineer working in the related areas and a source of technical information as well as a comprehensive reference in the field It should also serve as the source book for technical and business managers involved in microprocessor based design and manufacture The chapters are organized in a way which makes it possible to use this book as a textbook for graduate courses in advanced

digital and system design The book is intended to highlight practical problems encountered in designing state of the art processors while yet covering fundamental principles that are independent of technology

Continuous-Time Digital Front-Ends for Multistandard Wireless Transmission Pieter A. J. Nuyts, Patrick Reynaert, Wim Dehaene, 2014-01-03 This book describes the design of fully digital multistandard transmitter front ends which can directly drive one or more switching power amplifiers thus eliminating all other analog components After reviewing different architectures the authors focus on polar architectures using pulse width modulation PWM which are entirely based on unclocked delay lines and other continuous time digital hardware As a result readers are enabled to shift accuracy concerns from the voltage domain to the time domain to coincide with submicron CMOS technology scaling The authors present different architectural options and compare them based on their effect on the signal and spectrum quality Next a high level theoretical analysis of two different PWM based architectures baseband PWM and RF PWM is made On the circuit level traditional digital components and design techniques are revisited from the point of view of continuous time digital circuits Important design criteria are identified and different solutions are presented along with their advantages and disadvantages Finally two chips designed in nanometer CMOS technologies are described along with measurement results for validation

Memory Optimizations of Embedded Applications for Energy Efficiency Jong Soo Park, 2011 The current embedded processors often do not satisfy increasingly demanding computation requirements of embedded applications within acceptable energy efficiency whereas application specific integrated circuits require excessive design costs In the Stanford Elm project it was identified that instruction and data delivery not computation dominate the energy consumption of embedded processors Consequently the energy efficiency of delivering instructions and data must be sufficiently improved to close the efficiency gap between application specific integrated circuits and programmable embedded processors This dissertation demonstrates that the compiler and run time system can play a crucial role in improving the energy efficiency of delivering instructions and data Regarding instruction delivery I present a compiler algorithm that manages L0 instruction scratch pad memories that reside between processor cores and L1 caches Despite the lack of tags the scratch pad memories with our algorithm can achieve lower miss rates than caches with the same capacities saving significant instruction delivery energy Regarding data delivery I present methods that minimize memory space requirements for parallelizing stream applications applications that are commonly found in the embedded domain When stream applications are parallelized in pipelining large enough buffers are required between pipeline stages to sustain the throughput e g double buffering For static stream applications where production and consumption rates of stages are close to compile time constants a compiler analysis is presented which computes the minimum buffer capacity that maximizes the throughput Based on this analysis a new static streamscheduling algorithm is developed which yields considerable speed up and data delivery energy saving compared to a previous algorithm For dynamic stream applications I present a dynamically sized array based queue design that achieves speed up and data

delivery energy saving compared to a linked list based queue design **IEEE, ACM International Conference on Computer Aided Design** International Conference on Computer Aided Design. Institute of Electrical and Electronics Engineers, 2000, San José, Calif., 2000
