Circuit Design for Wireless Communications Kong-Pang Pun, José Epifanio da Franca, Carlos Azeredo-Leme, 2013-03-09 Circuit Design for Wireless Communications Improved Techniques for Image Rejection in Wideband Quadrature Receivers is the first book focusing on the subject of image rejection in wireless receiver design which has never been so important as high level of integration is highly demanded in the current and next generation mobile terminals In this book the image rejection problems in various receiver architectures which are suitable for high level of integration including image reject direct conversion and low IF architectures are studied The fundamental source of the limitation of the image rejection in these receivers is the imbalance between their in phase I and quadrature Q channels which becomes more problematic when the

receivers are of wideband Besides traditional methods this book provides novel solutions to the problem which falls into two broad types The first type refers to new circuits that produce less I Q imbalance This includes high performance switched capacitor Hilbert transformers and precise quadrature sampling circuits The second type is to compensate the I Q imbalance which is possibly frequency dependent in digital domain by calibration or signal processing techniques Design examples have been included Circuit Design for Wireless Communications Improved Techniques for Image Rejection in Wideband Quadrature Receivers serves as a very useful reference for wireless design engineers who want to improve the image rejection of their wireless receivers and researchers and students who are interested in this subject *Microwave and Millimeter Wave Circuits and Systems* Apostolos Georgiadis, Hendrik Rogier, Luca Roselli, Paolo Arcioni, 2012-09-17

Direct Conversion Receivers in Wide-Band Systems Aarno Pärssinen, 2006-04-18 This book is based on my doctoral thesis at the Helsinki University of Technology Several different projects during five years guided me from the

basics of the RF IC design to the implementations of highly integrated radio receiver chips Sharing time and effort between IC and system issues is not always straightforward I have been lucky to follow both topics and share experiences with diligent and enthusiastic people having different specialities As a result this book will cover a wide range of different topics needed in the design of highly integrated radio receivers Experiences from the first receiver prototypes for the third generation cellular systems form the basis of this book Most of the issues are directly related to the early proposals of European and Japanese standardization organizations For example the chip rate was originally set to 4 096 Mcps in a wide band CDMA channel I have kept that number in the book in most of the examples although it has been later changed to 3 84 Mcps I hope that the readers will accept that and the possible other incompatibilities to the latest specifications At least in the research phase the changes even in the most essential requirements are definitely not a rare incident and IC designers should be able to react and modify their designs as soon as they can

Wireless Transceiver Systems Design Wolfgang Eberle,2008-06-17 1 During the last 30 years wireless in communications has grown from a niche market to an economically vital consumer mass market The first wave with the breakthrough of 2G mobile telephony focused on speech placed wireless communication in the consumer mass market In the current second wave services are extended toward true multimedia including interactive video audio gaming and broadband Internet These high data rate services however led to a separate IP centric family of wireless personal WPANs and local area networks WLANs outside the 2G 3G mobile path Since diversity between data and voice centric solutions and the competition between standardized and proprietary approaches is today more blocking than enabling effective development of successful products a third major wave is unavoidable a consolidation of both worlds in portable devices with flexible multistandard communication capabilities enabled for quality of service 2 aware multimedia services At the same time the dominance of wired desktop personal computers has been undermined by the appearance of numerous portable and smart devices laptops notebooks personal digital assistants and gaming devices Since these devices target low cost consumer markets or face wired competition time to market is crucial designed in flexibility is important power operation is a key asset yet device cost shall be at a minimum This book approaches this design tradeoff challenge from the perspective of the system architect The system architect is concerned both in an efficient design process and in a competitive design result
