A Computational

FluidDynamics

A.1 Introduction

Numerical methods using digital computers are, of course, commonly utilized to solve a wide varie of flow problems. As discussed in Chapter 6, although the differential equations that govern the fle of Newtonian fluids [the Navier-Stokes equations (Eq. 6.127)] were derived many years ago, the are few known analytical solutions to them. However, with the advent of highspeed digit computers it has become possible to obtain approximate numerical solutions to these (and other flumechanics) equations for a wide variety of circumstances.

Computational fluid dynamics (CFD) involves replacing the partial differential equations we discretized algebraic equations that approximate the partial differential equations. These equation are then numerically solved to obtain flow field values at the discrete points in space and/or time. Since the Navier-Stokes equations are valid everywhere in the flow field of the fluid continuum, analytical solution to these equations provides the solution for an infinite number of points in the flow. However, analytical solutions are available for only a limited number of simplified fluid geometries. To overcome this limitation, the governing equations can be discretized and put algebraic form for the computer to solve. The CFD simulation solves for the relevant flow variable.
