Seaside Operations Planning in Container Terminals Frank Meisel, 2009-05-28

1.1 Motivation and Scope of Research Container terminals in seaports constitute interfaces between sea and land transport of goods in global transport chains These logistics facilities face an increasing demand of service capacity as is reflected by a tremendous growth in the worldwide container transshipments per year For example the top 20 terminals in the world showed an average relative increase of 14% with respect to the number of handled container units from 2006 to 2007 see Port of Hamburg Marketing 2008 In spite of this development competition is high among container terminals within the same region A terminal's customers first and foremost the vessel operators expect a high level of service quality where reliability is one of the most important dimensions see Wiegman et al 2001 Regarding the service of a vessel reliability means to realize all transshipment operations within its projected service time interval The reliability of terminal operations impacts the reliability of vessels in meeting their liner schedules According to Notteboom 2006 unexpected waiting times of vessels before berthing and unexpected low transshipment productivity at terminals are responsible for about 86% of liner schedule disturbances see Fig 1.1 Currently many terminal operators counteract this situation by extending their transshipment capacities They build new terminals or enlarge existing terminals and purchase new or upgrade existing equipment Ilmer 2005 provides an overview of current projects for building terminal capacity in northern Europe

Decomposition Techniques in Mathematical Programming Antonio J. Conejo, Enrique Castillo, Roberto Minguez, Raquel Garcia-Bertrand, 2006-04-28

Optimization plainly dominates the design planning operation and control of engineering systems This is a book on optimization that considers particular cases of optimization problems those with a decomposable structure that can be advantageously exploited Those decomposable optimization problems are ubiquitous in engineering and science applications The book considers problems with both complicating constraints and complicating variables and analyzes linear and nonlinear problems with and without integer variables The decomposition techniques analyzed include Dantzig Wolfe Benders Lagrangian relaxation Augmented Lagrangian decomposition and others Heuristic techniques are also considered Additionally a comprehensive sensitivity analysis for characterizing the solution of optimization problems is carried out This material is particularly novel and of high practical interest This book is built based on many clarifying illustrative and computational examples which facilitate the learning procedure For the sake of clarity theoretical concepts and computational algorithms are assembled based on these examples The results are simplicity clarity and easy learning We feel that this book is needed by the engineering community that has to tackle complex optimization problems particularly by practitioners and researchers in Engineering Operations Research and Applied Economics The descriptions of most decomposition techniques are available only in complex and specialized mathematical journals difficult to understand by engineers A book describing a wide range of decomposition techniques emphasizing problem solving and appropriately blending theory and application was not previously available
