SGT-750 Gas Turbine Case Study Mexico

Presenter: Mr. Douglas Petrie VP Business Development-Pipelines Dresser Rand a Siemens Business Houston, Texas, USA

Abstract:

The selection of Gas Turbines requires the evaluation of many criteria. First cost is important however the long term cost of ownership requires we look at installation cost, fuel cost and the cost of operation and maintenance.

On a recent project for a pipeline in Mexico CFE was looking for someone to build own and operate a pipeline for 25 years. The flow varied a great deal and increased gradually over time so part load fuel consumption and flow flexibility were also important. In this paper we will review how evaluations were made and discuss some technical solutions which allowed the owner to achieve greater flow flexibility.

Although industry standards exist for fuel consumption, compressor power requirements and available turbine horsepower suppliers do not always provide consistent values for these important pieces of information.

It is important to understand the differences between expected and guaranteed values. We must also be clear about whether guarantees are for part load conditions or only valid for full power. Finally we must understand tolerances allowed in common industry standards such as API 616, API 617 and the ASME power Test Code. (ISO references will be provided)

Only when all of these items are understood can the user understand the real long term cost of ownership.

Project Overview:

CFE, the national power company of Mexico, went out for public tender for companies willing to build own and operate a gas pipeline from El Encino to La Laguna. This will become part a national grid to bring gas from Texas and provide fuel for power generation with Mexico. CFE would provide a 25 year contract to pay for gas transport. The bidders were evaluated on the net present value of the transport cost including the bidders estimate for fuel. In addition there is a limit to the fuel available and substantial penalties if the operator exceeds that limit.

The pipeline required compression in order to deliver the contract flow at the contract pressure.

The performance and efficiency of gas turbine engines are to a large extent dependent on turbine rotor inlet temperatures typically the hotter the better In gas turbines the combustion temperature and the fuel efficiency are limited by the heat transfer properties of the turbine blades However in pushing the limits of hot gas temperatures while preventing the melting of blade components in high pressure turbines the use of effective cooling technologies is critical Increasing the turbine inlet temperature also increases heat transferred to the turbine blade and it is possible that the operating temperature could reach far above permissible metal temperature In such cases insufficient cooling of turbine blades results in excessive thermal stress on the blades causing premature blade failure This may bring hazards to the engine s safe operation Gas Turbine Blade Cooling edited by Dr Chaitanya D Ghodke offers 10 handpicked SAE International's technical papers which identify key aspects of turbine blade cooling and help readers understand how this process can improve the performance of turbine hardware Energy Research Abstracts .1992
